Does anyone know what the frequencies are
when the police say:

Go to channel 2
or
Go to channel 3

This is driving me bananas... I can't find them.

Thanks in Advance.

Depends on the scanner. There's all kinds of modifications you can do with scanners. It just depends on what you want it to do. Find a scanner you're interested in and search Dejanews in this NG by that scanner model number and a keyword of "modification" and I'm sure you'll find a boatload of info on what that particular scanner can or cannot do. Just be careful and double check sources. Because there's lots of opinions out there and all of 'em can't be right.

But if all you're interested in is the phone frequencies, there is a mod that will restore cell frequencies on almost any processor controlled scanner (Which is just about all of them nowadays). When the FCC imposed regulations on the scanner manufacturing industry, it sought a consistent way to assure that all scanners were restricted from receiving frequencies carrying private traffic. Rather than review each scanner manufacture's frequency blocking strategy, the FCC worked with an ad hoc council comprised of representatives of the scanner/radio industry and settled on a uniform methodology for restricting the range of processor controlled receivers manufactured for sale in the U.S.

What all processor controlled scanners have in common, is that the scanner's primary circuit board carrying the CPU and I/O logic functions is sealed with an anti tampering clear coat that increases resistance on circuit pathways thereby preventing the CPU's bus speed from reaching levels needed for receiving cell and other phone frequencies. It's a consistent way for the FCC to regulate frequencies scanners receive without the costs of testing associated with custom limiters on each and every model manufactured for sale in the U.S.

This clear coat can be removed from the primary board with a solution of 2 parts vinegar and 1 part of 50% diluted bleach. It is recommended that you remove the primary board from the scanner before doing this, I've heard of people swabbing the clear coat off the primary board while it was still mounted in the chassis, but that's more work than I'd care to do with a Q-tip.

It's recommended that the primary board be removed and soaked for 2-3 hours until the clear coat becomes pliable. Then remove any residue from the primary board with a clean soft cloth and thoroughly dry board prior to re-installing in the scanner. ;)

5. JAX frequencies and PD codes

Newsgroup: rec.radio.scanner
Date: 1999-02-01 00:00:00 UTC
From: Dan Morisseau <dpm3@inlink.com>
Message-ID: <36B684A8.B2A3F7F@inlink.com>
Source record: 128940
Cross-posted to: alt.radio.scanner,rec.radio.scanner

I'm doing an extended assignment in JAX a week on and a week off over the next few weeks. I've got the JAX PD UHF freq's, but the use of "Signal XX", Code YY" and "10-whatever" is mystifying. Are they using the standard APCO 10 codes? If not is the source for their codes and such? Also any list of other interesting frequencies in the area - especially aircraft en-route (airline "company") frequencies would be much appreciated. I'm using Monitor America 3rd Edition already and am wondering if there is more. Thanks for your assistance

Sorry, but I think this is quite a lot of bull....

I know of NO LAW in existance in the US that prohibits
ANYONE from owning ANY radio capable of transmitting
with restrictions like you say.

There ARE laws about type acceptance and complaince,
and possession of certain equipment is prohibited, but
NOTHING against the possession of a specific gear
such as a transmitter.

So, unless you can direct people to a source....

8. Re: WINRADIO

Newsgroup: rec.radio.scanner
Date: 1999-02-01 00:00:00 UTC
From: mr_grumpy@pissed_off.com
Message-ID: <36b5fc1f.13141324@news.ozemail.com.au>
Source record: 128943

Wow, you sure have some stong feeling there, pal.

>My walkman isn't sensitive enough on the AM broadcast band. That
>doesn't have anymore to do with anything than your radar detector analogy.

I was trying to suggest that over sensitivity can be be as bad as lack
of sensitivity but why bother......you know it all.

>> I guess (with some intelligence) that winradio and the icom
>>are suffering the same problem. Argument #2 stopped.
>
>Actually Winradio seems to be the one that suffers. Rather than guess (even
>with lots of intelligence) try using the specs and reviews by hands on users
>to form an opinion rather then trying to sell WinRadio.

I'm not trying to sell Winradio - merely address what seemed to be a
very biased and pro Ten Tec comment.

>
>>In their
>>defence, at least winradio is making some high end radios for serious
>>applications. Go see a government installation and count the number
>>of "cheap off the shelf" radios there. I reckon ZERO.
>
>Really, then where the hell did all the off the shelf Icoms come from at
>these government installations ?

Icom radios are not cheap off the shelf radios. Re-read the statement
please. I don't see my local cops or the local office of the coast
guard using sub $1000 radios. I don't see SETI or NASA using sub $1000
radios.... I am not saying Winradio is better than Icom, I am saying
that low cost wide-band radios cannot be compared with dedicated HF
receivers and at least winradio is making some high-end recivers for
applications where a better receiver is required. Again I make no
comment about Icom or any other manufactuer.

>>What are hobbies all about?
>
>I take mine quite seriously at times. At least when it comes to my gear. I
>know many others that do to. BTW, in the field of radio, hobbyist have been
>responsible for many advancements. Don't sell us short.

I state again, what are hobbies all about. Fun does not have to mean
careless or lack of seriousness and your comments about hobyists being
responsible for advancements is true but irrelevant. With comments
like yours, company's like winradio should just shut up shop and go
away.

>> If
>>you need to save lives, predict storm weather or eaves-drop on the
>>President, go buy the stuff dedicated or desgined for the job.
>
>Yep, like many of us serious non-professionals buy.

But don't complain if its not as good as more expensive stuff. Damn,
a hyundai is cheap and a Ferrari is fast - to get both you have to
compromise on something.
>
>>However, if you want FUN, and to get another use from your PC, why not
>>try one of the new style of receivers.
>
>The question is why waste your money on Winradio with the Icom as a better
>choice?

Who said buy winradio? Re-read it. I said "new style receivers" NOT
WINRADIO and NOT ICOM.
>
>> I would not be surprised if
>>some one wasn't already working on a PC based transceiver. Perhaps
>>the kenwood or yaesu reps reading this can answer..... Argument #3
>>stopped.
>
>You can't stop squat pal because you give an impression you don't know
>squat.

Intellectual response using your whole vocabulary I guess.

>There have been PC based transceivers for a number of years. All you
>seem to do is guess and generalize about things you seem to know very
>little.

A number of years? PC based trasnceivers for the hobby market? My
you do have a secret channel of information. What are the names?
Models and where can I see THREE different models. From different
manufactuers. I know of only one or two and these are less than 1-2
years old.
>
>As I recall you made a smart ass remark to a poster about their possible
>affiliation with Icom. Well if you aren't a paid WinRadio lobbist, you sure
>fooled me.

Ain't it nice to see in the land of free speach that I cannot even
have my say> Flaming sure has taken over the newsgroups when logic
and reason left! Quit the bad language and adopt some reason please.
Re-read my comments - I painted wirnadio and icom into the same
picture or is an analogy like that too hard for you? And the
relevance to this argument that I have made remarks in the past is
what?

I have a life that revolves around more than just flaming others on
the internet - therefore I have chosen no to participate in this any

longer. You may read this as defeat - ha! It seems as this forum has become a vehicle for undercover company representatives and disgruntled customers to express biased views. 73!

>

Because the base is probably transmitting with 100 watts or more of power, from an antenna that is 50 feet or more in the air, while the mobile puts out maybe 25 watts tops, with an antenna that's no higher than car fender.

I may open the door for alot of mail on this one, but I work for Shack and when ever you purchase an item that requires batteries, adapters, etc. it appears on the Point of Sale screen when the sales associate rings it up. It lists the part number recommended for the unit that you are buying. So from now on if the associate gives you that stupid stare, tell him to do a price lookup and get you the associated additional adapters that you will need to make your purchase complete!!
(Sounds like you had a parttimer or just a new employeee)
Just food for thought.

18. List of the rec.radio newsgroups

Newsgroup: rec.radio.scanner
Date: 1999-02-01 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <794g3k$ddt@news.Hawaii.Edu>
Source record: 128995
Cross-posted to: rec.radio.info,rec.radio.swap,rec.radio.scanner

```
Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and the
contents of such a thread drift further and further away from being
"on-topic" in the various NGs that receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

Jeffrey Herman, WH6U
(rec.radio.amateur working-group)
```

19. Re: Police mobile

Newsgroup: rec.radio.scanner

Source record: 128996

Simple way to calculate reliable range (you can hear farther, but this is the rule of thumb for RELIABLE range you can hear something)

Square root of your antenna height in feet, plus square root of transmitter antenna height in feet equals range in miles.

At a guess, for you: Your antenna, 20' up. (on your roof). Car antenna, 6 feet. That's 4.47+2.44=6.91 miles (call it 7, it isn't THAT accurate! <grin>)

The base, on the other hand, is probably at least 100 feet up on a tower. That'd be 4.47+10, for call it 15 miles.

If the base relays from a mountaintop, it's a good bit farther than that.

Iceberg,
Go into your local store, blow right past the stupid associates, who obviously dont know their own store, and go to the "Radio Shack Unlimited" books that should be hanging from a display. Grab the orange book (parts) and look up the cat number for your radio. There you will find all the parts you will ever need including screws, case and keypad. I work at Shack and find it really sick that these idiots (employees) dont know their own store!!! Talk to the manager and if you dont get any satisfaction, get the number for the district manager and bitch to him.
Hope this helped.
Frank K

You can't fix it. All you can do now would be to go buy a real radio,
preferably one that glows in the dark and emits a slight odor of super-heated
dust and old electronic components and get a long piece of wire and attach it
to the "ANT" terminal on the back.
This will most likely give you lots of listening pleasure, without having to be
concerned about soundcards, monitor inputs and would completely eliminate the
necessity to involve your home stereo.

22. My PRO2006 and 800MHZ + Trunked Freq.

Newsgroup: rec.radio.scanner
Date: 1999-02-01 00:00:00 UTC

I am kind of new to trunking but here are my questions.

1. With my PRO2006 I can put in an 856.1275 and hear a city, is this because this trunked system is using analog??
2. When would I need a trunking scanner vs my PRO2006??
3. Are the answers if it is a certain kind of 800mhz system that does analog I will be ok but other than that I wont be.
4. I think I am right when I cannot hear a digitilized 800mhz system with my system or a trunktracker.

23. RD/LAP Decoding - Project Update

Newsgroup: rec.radio.scanner
Date: 1999-02-01 00:00:00 UTC
From: Phil Smalley <ziggy7445@yahoo.com>
Message-ID: <794p36$6r4$1@phxtst22.phx1.aro.allied.com>
Source record: 129000

Just a quick note to all regarding this project - bad news I'm afraid for all you sound card decoders out there....

Gordon Edwards provided me with some excellent source code that I could use to create a simple little program to sample the soundcard and report back the values it receives from the scanner. So, I set the scanner to some known RD/LAP freq's in the area and set the program in motion, hoping to see the expected 4 levels of audio, one for each symbol received.

What I got instead was 2 values: 247 and 1, which means 2 of the 4 levels was getting lost. After thinking about it, it makes sense. In order to properly decode a 4 level FSK signal the soundcard would have to split it into 2 channels. The 247 on one channel would be a 1, on the other it'd be a 3, and so on. But, our discriminator signal is not stereo - it's mono. While the various decoder boards can still separate the levels, the soundcard can't. It needs a stereo signal. Given that I'd say that writing a soundcard based version of this thing will not be possible.

However, using a 4 level decoder circuit, it can still be accomplished. I will fully pursue that route as soon as I get my hands on a decoder board. Any recommendations on which circuit works best? If it decodes FLEX with 90% or better accuracy it'll work well with RD/LAP as well.

Thanks to all who have contributed so far, we are very close....

-Phil

Hi,

I'm a total newbie in this arena. I'd like to buy a scanner in the $200 to $250 range. I figure that buying a cheap scanner could prematurely kill my enthousiasm and buying too expensive could kill my wallet. :) I think I'll opt for a handheld. I read the FAQs but still I'm left with some questions. Maybe someone on here would be so kind and help me out with the answers.

Are trunck tracking scanners able to receive regular ol' transmissions which you can hear on a "regular" scanner? Like ham radio, air traffic etc....

Are the RS trunck tracking scanners any good? (I think they're made by Uniden, but I'm not sure.)

Is there any particular brand/model you would advise me?

Do scanners come with different modes (AM/FM/SSB) you can switch to or are the modes more or less linked to the frequency band?

Is it useful to have a mode switching feature? (If such a thing exist of course.)

I would appreciate it very much if you could help me with these questions!

Hi All,

I have a Lowe HF225 Reliever and I understand that there an interface,
that allow you to interface with software on a PC.

Can this interface be home built or do I have to by it ready made.

If it can be home build where can I get details from ?

Many thanks

Ever heard of lack of sensitivity? Scanners and HF don't have Highway and City mode. My walkman isn't sensitive enough on the AM broadcast band. That doesn't have anymore to do with anything than your radar detector analogy.

> I guess (with some intelligence) that winradio and the icom
>are suffering the same problem. Argument #2 stopped.

Actually Winradio seems to be the one that suffers. Rather than guess (even with lots of intelligence) try using the specs and reviews by hands on users to form an opinion rather then trying to sell WinRadio.

>Serious non professional users (different from amateurs - think about
>it) don't use sub $1000 devices and expect the world from it.

Devices? You can't make a blanket statement like that and expect people to buy it do you? And yes there are sub $1000 devices that give you the world from them.

>In their
>defence, at least winradio is making some high end radios for serious
>applications. Go see a government installation and count the number
>of "cheap off the shelf" radios there. I reckon ZERO.

Really, then where the hell did all the off the shelf Icoms come from at these government installations ?

> So, what I amsaying is that YES, these are toys.

No Winradio is a poor performer but we should buy one anyway..

>What are hobbies all about?

I take mine quite seriously at times. At least when it comes to my gear. I know many others that do to. BTW, in the field of radio, hobbyist have been responsible for many advancements. Don't sell us short.

> If
>you need to save lives, predict storm weather or eaves-drop on the
>President, go buy the stuff dedicated or desgined for the job.

Yep, like many of us serious non-professionals buy.

>However, if you want FUN, and to get another use from your PC, why not
>try one of the new style of receivers.

The question is why waste your money on Winradio with the Icom as a better choice?

> I would not be surprised if
>some one wasn't already working on a PC based transceiver. Perhaps
>the kenwood or yaesu reps reading this can answer..... Argument #3
>stopped.

You can't stop squat pal because you give an impression you don't know squat. There have been PC based transceivers for a number of years. All you seem to do is guess and generalize about things you seem to know very little.

As I recall you made a smart ass remark to a poster about their possible affiliation with Icom. Well if you aren't a paid WinRadio lobbist, you sure fooled me.

>Got any more...I'm enjoying this.

They do make scanners with switchable modes am,fm,ssb,but not for $200,but the less expensive radios will just switch on there own. Yes the trunk trackers will scan conventional radio as well.I own a RS pro-90 and it is made by Uniden and I really love it and I take it everywhere,I think I only paid about $220 for this one and it was definatly worth it.

Keep listening

Allow connection to ground at ONLY ONE place: computer OR stereo end.
Use Use 3-prong to 2-prong plug adapters (49 cents at hardware store)
to interrupt (not connect) the third (ground) pin at the outlet(s).

I ran into this problem myself. Except, the ground loop was being introduced via the cable TV hookup. The solution? I took two RF Cable TV Baluns back-to
back. Worked like a champ. Another solution is to use a pair of car stereo isolation transformers on the computer to stereo audio line.

I have to disagree here.

Digital modulation does two things: It improves the quality and bandwidth usage for these agencies and it (for now at least) ensures that average-joe-dumb-crook isn't going to be able to easily eavesdrop on them. Most scannists are smarter than that - most are decent law-abiding citizens who make a decent living, and don't feel it necessary to commit crime to get ahead. The police know this.

Also, by running full crypto all the time, you actually weaken the security of the system. The APCO25 guy who has posted here about the decoder he is building brought up a valid point: All one would have to do is receive an encrypted ASTRO transmission, separate the frame sync bits from the audio bits, simply rearrange them until you have a valid frame sync sequence and presto! You just found the key. It makes much more sense to encrypt only sensitive comm's, such as vice operations/SWAT/etc on an as needed basis, keying the radios at the command post or during the operation briefing, so that encryption is only used occasionally and the key changes with each operation (much easier to do if you only need to key a dozen radios instead of the whole fleet). There are methods that allow the whole fleet to be rekeyed over the air, but if you've grabbed the key previously, you could capture the new key as it was being transmitted to the radios, making it as useless as before. The police are aware of this as well. So far, the only agency I know of that is supposed to run full crypto all the time is the FBI, and even they broadcast in the clear sometimes, because the radios don't always work well in encrypted mode.

-Phil

Here is a good twist on this thread. Anyone who monitors or used to monitor LA County Sheriff know how the mobiles in Palmdale/Lancaster can transmit back to SRC in the LA basin? Listening to their input frequency is again, only good for about 5 miles or so. On a ride along I did once, I was in the station and heard the mobile units talking over the busy tone they transmit. You could clearly hear the officer, while the "beep-beep-beep" of the busy tone was in the background. They have a microwave link to SRC (you can see the dishes on their base antenna at the station) and I suspect that those dishes relay the mobile comm's back to the dispatcher. Anyone ever monitor those frequencies? I think the AOR scanners that go up to 2.5GHz could do it, although I must confess I never tried while I lived there.

Also, here in Phoenix, the PD uses a VHF simplex system, and the results are roughly the same: outside of 5 miles away, you can't hear the unit. How does the mobile comm make it back to the base station downtown if they aren't using a standard duplex base/mobile frequency pair? Obviously it does, but I just never really gave it much thought until now. Good topic!

I have a brand new Standard AX400E handheld scanner. This unit covers 500 KHz
to 1.3GHz with no gaps. It receives FM, WFM and AM (no SSB or CW)
This unit is brand new and is mint.
Check the review on the link below and read the review.

http://www.strongsignals.net/htm/revw2000.htm

I would like $240.00. plus COD shipping.
Read the review carefully, it is quite comprehensive, and let me know.

No kidding Leonard. If TenTec would come out with a wideband receiver it would be awesome. But from the conversations that I have had with the folks there, they do not seem to have any interest in anything above 30mhz. So I rather doubt that we will see our dream radio become a reality. I did have several conversations with the guys at WinRadio, and I have a strong suspicion that in the next year or so they will come out with a surprise for us. I do know that trunktracking is on their agenda and that is a almost sure thing. I just can't wait for them to get serious about their HF reception. You are also right that anyone that spends a lot of time in front of the computer and are likely to use it as opposed to a handheld or desktop type unit, can find some usefulness in a PC run unit.

I think you should look for (used) professional equipment in the US$ 2000 - 5000 range.
Have a look at HARRIS (RF590 for example) or Rhode&Schwarz for ISB-functionality.
Sometimes you can find it at HAM-fests or in HAM-NGs....

>

Tony,

You will certainly be able to monitor the aircraft landing and taking off from LAX. Whether you will be able to hear the controllers from your house will depend upon the terrain (if you're on a hill it will help), exactly where their transmitter is located, the antenna you use and more. Chances are, from 10 miles you may well be able to hear the controllers from home. You will certainly be able to hear them when you go to the airport.

As for price, scanners with VHF civilian airband start at about $100 new at RadioShack and the price increases depending upon what other features the radio has. Scanners that include the UHF military airband are more expensive, starting around $260 for the Sony SC-1, and going up to near $1,000 for a handheld, and over $2,000 for a table model with shortwave and lots of other features.
The more expensive radios are hard to find in local stores, except for those that cater to ham radio operators. You're better off to check out someone like Lentini Communications at www.lentinicomm.com for the better radios.

Yes, the earth is round and radiowaves travel in straight lines. Therefore
you can hear the base because it is transmitted from a very tall tower that
can send it's signal over much of the earths curvature, but you must be near
the police cruisers because they transmit from close to the ground and their
signal is soon obstructed by the earth.

if you can use an earth ground and run thick wire to all three.
if not try running a big piece of wire to each of em.
make sure the wire touches a bare piece of metal on each case

hope this works

maybe its just me but it sounds like you want a signal strength meter. well a watt meter wont work and you can build one that hooks up to the antenna.
there are several that hook up inside your radio and run wires to an external meter
but they dont use the antenna line either

> signal is soon obstructed by the earth.

It's also possible Chip is hearing the input to a repeater since he didn't specify
the frequency. That could account for only hearing the base and not the mobiles.

Other factors could also be what kind of antenna he's using, maybe his scanner isn't performing up to specs, there could be obstructions in the path, terrain, etc.

>He took the radio and keyed it up and was talking to the
>:dispatcher on it.

There's your main problem right there and the probable cause. You had a radio capable of transmission on a freq you were not authorized to use or had a proper license to be on.

DUH.

in the newsgroup rec.radio.scanner,
pstmg@yahoo.com (Martins)
from thoughtfully posted:

> Hi !
>
> How can I receive Navtex stations with hamcomm modem ? Pse, send also
> some frequencies and time (utc)

How about from the "horses mouth":

http://www.navcen.uscg.mil/marcomms/gmdss/navtex.htm

Or do a Net search for "Navtex".

Also see this site:

http://www.gem.net/~berri/wun/files/navtex/navtex.html

The transmission protocol is Sitor-B (aka: "AMTOR" or "FEC"). The
data rate is 100 baud with a 170 Hz shift.

The transmissions are NOT continuous. You will have to look at
the broadcast schedule for your region. The transmissions usually
last for about 20 minutes or so.

Cheers,
Paul Grohe

Visit the Moxina Mind Spring for some awesome new download
Freeware. These new programs by MAX are a 4 channel logic
analyzer for your parallel port ....and new home electronic " repair "
software ....Soundcard Data Stream Analyzer. This software can
decode reverse and forward analog cellular datastreams and
can decode the datastreams of many popular cordless phones.
This software should make those "home " repairs and
" experiments " a technical breeze. This software can
also likely be used for that home " repair " of garage door
openers, car and home alarm controls too.

As usual there are no banners , no ads , no commercials
no nada ...just technical freebies from the TIgEas LAiR.

The Jan/Feb humor download is now available and
the Free christmas gift is back by popular demand.
(same down load screen ad the humor download)

for those with handheld computers ...there is free download
plans to build your own automotive adapter.

the Moxina Mind Spring " techno freebie site " is

http://home.pacbell.net/kaliber/Index2.htm

81. GMDSS Trainer

Newsgroup: rec.radio.scanner
Date: 1999-02-01 00:00:00 UTC
From: hamilton2570@my-dejanews.com
Message-ID: <793uhfiqr1@nnrp1.dejanews.com>
Source record: 129081
Cross-posted to: rec.radio.scanner,rec.radio.shortwave,rec.radio.swap

This software is used to
provide the user with information related to Global Maritime
Distress and Safety System;
help him acquire skills of usage of radio communications equipment
used within GMDSS.
All data provided by the software fall into the following categories :

text;
pictures;
short video films;
short audio pieces (both speech and music);
binary databases (tables);
executables each simulating a certain radio equipment.
All these pieces of data are cross-referenced in a multiway
chierarchial-tree global structure. In effect, they form a hypertext
system, one of its well-known advantage
being the ability of the user move within a "layer" of data
corresponding to his current level of proficiency; but if necessary, he
may "descend" to the very basics of any
issue, e.g. to a physical definition of oscillations.
All the above components of the database are easily added and
modified; it does not require recompiling of the software (except
executables).
The total size of the database is limited only by free disk space.
The program is installed on a local area network, each station
representing a ship, coast radio or shore-based subscriber station and
it can work as a standalone
workstation.
The program simulates work of radio communications equipment,
including sending/receiving messages and voice to/from ships. The voice
communications are implemented with a Sound Blaster audio card installed
on each computer.
Three different types of workstations are available : shipborne, coast
radio and subscriber stations. The latter two simulate an exit to
shore-based communication networks.
In a sense, this program is self-documented and almost all data
presented in this manual is easily reached right from the program.
The program is released in two versions : full version for local area
networks (LAN version) and standalone version for onboard training.

I have been using the Antenna Specialists "MON" series for both mobile and base for many years. As far as I am concerned it out performs a discone hands down. Works great from 42mhz to 856mhz. It's a little large for mobile but well worth the hassle of looking out for parking structure roofs.

Communications Electronics says that the Uniden 245XLT will be available in July 1999; they're taking orders now for $269.95 plus shipping and handling. I can't vouch for the reliability of Communications Electronics, as I've never used them; maybe others can comment. Their 245XLT announcement is at http://www.usascan.com/html/body_cei_news.html.

I don't know how prevalent the Ericsson systems are; here in the Tampa Bay area we have both Ericsson and Motorola systems. Another thing to keep in mind is that many trunked systems are headed for evolution to digital rather than analog. Digital trunked systems will be beyond the reach of even the 245XLT. I expect that Uniden will eventually market scanners capable of following digital systems as well, but if the digital systems are encrypted, there's no way we'll be able to listen to them without the encryption codes. So, depending on how much money your local government agencies have, and how badly they want to hide their transmissions, you may have less than a year or several years before your local police and fire radio traffic goes beyond the reach of a TrunkTracker.

I dunno, I am actually new with this shit, I think I am going to get the BC235XLT actually! Could you tell me if this is a good one for the Concord Massachuesetts area? I live there and the state police use trunked systems. That sux, because I wanted to listen to peoples cellphone calls. So there is not possible way to get the cellular, because I read a review by some guy (he tested one) at http://www.strongsignals.net/htm/imp235.htm and he said that when he tested it near a cellular tower he got a lot of shit. Could you check this out for me, and, if you please could, forward any responses to polothon@bigfoot.com so I can read it during the day at school? Thanks so much, and if any other reccommendations anybody has please say so, (especially Phil Smalley, thanks)

Just got one today at a place that buys closeouts and damaged goods for $159. Yes, it's the PC model!
Looks and works perfect! I about passed-out when I saw it sitting on the shelf with all the other stuff.
Will install the software and report back to the group.

Hi Guys,

I wonder if there are any posted mods for this new Sony scanner?
What about a discriminator mod for trunking/paging?

Any help is greatly appreciated!

Dan

I bought a PRO-91 as my first scanner 2 months ago and have no
complaints; it works fine for me. I've been recharging the 4 AA Nicads
overnight and they work fine also. You can read a review of it at
http://www.strongsignals.net/htm/imp91.htm, and a review of the PRO-90
(much the same as the BC235XLT) at
http://www.strongsignals.net/htm/imp90.htm.

98. Re: Difficulty in Programming a Radio Shack Mobile Trunk Tracker

Newsgroup: rec.radio.scanner
Date: 1999-02-02 00:00:00 UTC
From: Wayne Farmer <WayneOHere@compuserve.com>
Message-ID: <36B7CD65.2E22@compuserve.com>
Source record: 128848

Just go through the manual slowly. If you're interested just in trunked systems at first, start on page 42. Make sure you follow the instructions: Turn the unit on. Set Squelch as indicated in the manual. Press PROG, then TRUNK, then the trunk bank number you want to use (1 to 5), and then enter the frequencies that belong to the trunk, using numbers and the decimal point. If you have the volume up, you should be able to hear any traffic on each frequency after you enter it. If you make a mistake, press the decimal point again and re-enter the frequency. Press E and PROG after each frequency. Press SRC when you're done. Note that you can only enter trunk frequencies in the range 851.000 to 868.9875 MHz; the PRO-91 can't handle trunks that cover frequencies outside that range. Also, you can't enter more than 30 frequencies in the bank.

When you press SRC, you should see the unit slowly scan upwards through the frequencies you entered, looking for the control channel (the one that's buzzing all the time, with no voice traffic). When it finds it, the screen will change to -----, and then you'll start to see the talkgroup ID's as traffic appears. The speaker will come on for each conversation.

> another one.,..
>
> Great phone except for the early keyboard failure..

Same for me. Keyboard problems developed after about 18 months
and got quite bad by 22 months. Mine was a VTech rebranded for
Toshiba. Toshiba will give you a new or refurbed phone for $60
which may or may not be a good deal depending on how high or low
end your particular model is. Toshiba's turnaround time is really
good. I was only without a phone for under 2 weeks from the time
I mailed it. Fortunately for me, I bought my phone from Shopper's
Advantage so I had a full 2 year warranty. By the time I got
around to mailing it back to Toshiba, the warranty was in the
final month!

The bottom line is that Vtech phones should be considered to
have a lifespan of 2 years. Otherwise, they are pretty good
phones. My phone had much less sidetone than the Escort DSS
I tried two years ago.

Hi,
If they want $150 apiece, be assured they paid no more than 30 to 50 for each of them. Make a lowball offer, I just got one at a local pawn shop for 75, in good, unscuffed condition. $150 should get you a good used handheld in clean condition. I always check to see what's in the memory banks and then try scanning them, check the back light and then try one of the NOAA weather freqs to see if the audio is ok. Good luck

110. Another antenna tip

Newsgroup: rec.radio.scanner
Date: 1999-02-02 00:00:00 UTC
From: Andy Moss <enzo@ibm.net>
Message-ID: <36B721B9.1703@ibm.net>
Source record: 128894

Quite often when building antennas you need to support an element but have it isolated from the boom or standoff.

I made a small antenna from aluminum pipes and stumbled upon a neat way of attaching two elements together physically, but not electrically. I took some PVC plumbing tube and heated the end up with my heat gun. This made is soft and pliable and I was able to easily push it over my aluminum rod. Once cool I did the other rod. I ended up with a two rods joined together with a short pice of PVC. The PVC cools as it shrinks and makes a really good connection. It also appears to harden and becomes more rigid. I didn't need any more strength in my design, but if I did I would have put in a shim. Anyway, it worked perfectly for me and it looks professional.

Thanks for your input! I was looking at a pro-90 or pro-91 too.

I'll check out the sites. (I think I've read a FAQ originating from that site
I think, but I'm not sure). Do you think the new 245 will be similary priced?
I dunno if I want to wait that long though. I guess in a few months I can
sell the one I buy now and upgrade to the 245. Btw, is the Ericson system
widely used?

Thanks for your information!

118. RCA Model 16S400 - 136 MHz possible?

Newsgroup: rec.radio.scanner
Date: 1999-02-02 00:00:00 UTC
From: "Evan L. Hill" <evanh@primenet.com>
Message-ID: <797c5lpqq1@nnrp03.primenet.com>
Source record: 128902

I have a 1970's vintage crystal controlled RCA 16S400 that I want to use for the reception of the EMWIN broadcast in the 137 MHz range (downconverted).

Nameplate says that the VHF Hi range is 150-170 Range.

Does anyone know if RCA had a modification to take this radio into the lower end of this range, or if this is even possible.

I have no schematic or users manual with this radio, or I'd look there.

120. PRO-64 '3 - error' what gives?

Newsgroup: rec.radio.scanner
Date: 1999-02-02 00:00:00 UTC
From: tracy jones <tracyjones@cinergy.com>
Message-ID: <01be4ed2$9b546290$884214ac@H1VFT4>
Source record: 128904

Hi all,

I downloaded the program and built the interface cable from the excellent instructions found on Bob Miller's web page. I checked the cable for continuity and it rings out just as it should.

When I hit the 'LOAD' button the scanner instantly displays '3 - error'

I Reset the scanner (several times) but still got the error so I then Initialized the scanner and I'm still getting '3 - error'

I've even tried to STEP (1 freq at a time) thru the load process and that gives the same error.

I also adjusted the settings on the Comm Port to 2400 baud, 8 bit yadda yadda.

When I get a chance, I'm going to try a different computer but I don't think that is going to help.

What is the problem?

What else can I do?

Thanks

Tracy

First, what is the scanner. Scanner Mods do not work on different models, so you need to let people know what scanner you are talking about before you start aksing questions about it.

Hello,

I am currently decoding the IC-R10 memory map, and have written two small applications. It would definitely help if you try one of them, or both. MD10 should work for everybody that has the OPC-478 cable (and, of course, an IC-R10). CA can be used if you also use CS-R10 and are interested in the memory contents (but only if bytes do not scare you). Please take a look at :

http://www.xs4all.nl/~jstuyven

and make sure your serial number is registered. Thanks in advance,

Joost

>N1DVJ

Mike,

I really don't think that we're getting the whole story here. If he's being charged on the posession of the radios, there's probably a harmful interference situation that he neglected to mention. That would also give the PD their probable cause to seize the other radios. If somebody wanted to really stretch the interpretation, having a radio that is transmit capable, without being licensed on a specific frequency, or the permission of the license holder is in violation of part 90. But the fact remains that he has been charged (or so he claims) with theft of trade secrets. It doesn't appear that the posession of the radios is the illegal factor, but the posession of the programming software used to program the radios. It's a known fact that Motorola guards their software very closely, especially Labtools and the like. If he isn't an authorized MSS, he shuldn't have software that is limited to shops that have been approved as MSS depots. The seized radios would be used as evidence that they could not have been programmed without the proprietary software, thus causing a violation of Motorola company policy and copyright protection.

138. DOS PCR-1000 Control Program - Update available

Newsgroup: rec.radio.scanner
Date: 1999-02-02 00:00:00 UTC
From: "Ray M. Ransom" <*micosyen*@bigbear.net>
Message-ID: <797rs9$jc9$1@remarQ.com>
Source record: 128922
Cross-posted to: rec.radio.scanner,alt.radio.scanner

DOS Control Program for Icom PCR-1000. You don't need an expensive Windoze computer to control your PCR-1000 to do all sorts of scanning and searching. Any old laptop and most palmtops will do, and with many more features than the Windoze program that comes with the radio. This program will also run VERY fast in a DOS box under Windoze 95/98.
==========
New version available.

The following bug has been fixed:

- Serial ISR problem that could have caused missed data.

The following new features have been added:

- Command line switch to specify initial volume.
- Command line switch to specify initial squelch.

It may not have all the bells and whistles of some Windoze-based PCR-1000 programs, but it's guaranteed to be the easiest-to-use scanning program available. And it costs a lot less too. That's because it's still free. Please use the e-mail link at the site below for comments, questions or bug reports.

Does anyone have the mods and the schematics for the Bearcat 760 XLT. I have seen the one where it states that it may be like some other type, well, I don't do like some other type. If you have them please reply.

Thanks

I recently purchased a new pro 91 radio shack mobile trunk tracker.
I am having real difficulty programmng it. I am going to the trunk mode and
seeing
5 bands for trunks tracking I go to enter the frequencies and they wont let me
enter them I find the manuel confusing Could someone be so kind and e mail
me the steps in English LOL or post to the group I would be most appreciative
Many thanks

142. Re: 900 MHz phones

Newsgroup: rec.radio.scanner
Date: 1999-02-02 00:00:00 UTC
From: Ari <nospam@pacbell.net>

Source record: 128926
Cross-posted to: alt.consumers,alt.radio.scanner,misc.consumers,misc.consumers.house,rec.radio.scanner

Regarding the VTECH 900 MHz phone keypad failures...the early ones, like my "Tropez digital 900DX", *CAN* be fixed by disassembling the phone and cleaning the crud (which looks like some sort of oily goop) from between the
keypad's membrane and the circuit board contact. I did this recently after living with a mostly useless keypad for a couple of years...the 900DX is about 5 years old...and works fine now!

Considering that I got it on sale back then for $99 ($349 list), I'm very pleased with the $20/yr it's cost me.

some forwardings (of mine):dolph wrote:

> Hello
> Can anyone lead me in the right direction for a faq on different
> antenna lengths for monitoring different frequency ranges?
> Any response appreciated!
> Randy

Take the lightspeed in kilometers/second and divide it through frequency in
khz and you get the wavelength in meters.
for example: 300.000 dvided by 30.000khz is wavelength 10 meters.
or another example: halfwave-antenna-length is 17cm so full length is
34cm=
0,34meters
300.000 divided by 0.34 is 882.352,941 khz =882,352941 Mhz

To get the legth in inches divide the meter-measure by 0,0254
example: 3,685 meters divided by 0,0254 is 145,0787 inches.

Now its to you to do some mathematics on 1/4, 1/2, 5/8, 3/4 and full
wavelegths antennas ;-))

regards
odo

> >
> > Thanks in advance.
> >
> > Marc
>
> Physical ruels:
> Lenght (in meter) = 300 000 / frequency (in hertz)

is length in kilometers !!!!!!!!!! because lightspeed is in KILOMETRS / second
OR give the frequency in KHZ

>
> examples: for CB (27-28 Mhz) the full lenght is 11 m. so 300 000 / 27 000

... khz !!!??? is factor 1000

> =
> 11,11 m
> or 1/2 wave = 5.56 m or (must frequently) 1/4 wave = 2.78 m
> Sylvio HE9JYP

How did you get your licence ? ;-))
However, - you shouldn`t become a teacher- :-))

do the maths:

300 000 km 27 000 000 oscillations
---------- / ---------- is
sec sec

300 000 km sec
= ---------- x ----------
sec 27 000 000 oscillations

is in Result: Length in km / oscillation = Wavelength (in Kilometers!!!!)

(deviding a quotient by a quotient is done by multiplying the reciproke)

Source record: 128949

Check this scanner out !!! $15,000 !!!!!
OSCOR 5000 total surveillance scanner.

http://www.spyworld.com/oscor.htm

It will scan from Audio (50 Hz-15 KHz), Radio VLF-Microwave (10 KHz-3000 MHz)
to Infrared (850-1070 nm) and utilize passive sound-pattern matching to
automatically
recognize a surveillance device.

VIDEO Option Multi Formats allows the OSCOR to provide viewing of video
signals.
Used for detection of covert surveillance cameras. Supports NTSC, PAL and
SECAM.
Includes a video demodulator circuit board that must be installed in the OSCOR
main
unit and two video monitors that fit inside the OSCOR storage Compartment.
Video Patch Cord that allows received video signals to be fed directly into an
alternate
video monitor or a video recorder. Video output is provided in a standard RCA
plug.

Audio Recorder with Cable: Audio micro-cassette recorder that connects directly
into
the connector tray to use the OSCOR audio recorder functions.

>Does the ALINCO compare to the Pro-43 in anyway?

The PRO-43 scans faster and longer battery life.

The Alinco DJ-X10T has much wider
frequency coverage (including shortwave), product
detector (for SSB/CW listening), and many more features.

From my FAQ article SCANNER RADIO REVIEW BRIEFS:

[...]

ALINCO

DJ-X10T: 1998 vintage. Rugged construction - metal back.
Multimode frequency coverage 0.1 to 2000 MHz (minus cellular
bands). 20 selectable step sizes from 0.05 to 500 kHz.
Knob atop the radio clicks when rotated and serves as a VFO
knob, channel selector, and menu navigation control.
Several battery pack options for NiCd and alkaline battery
cases. Furnished with an EBP-37N 4.8 V, 700 mAH NiCd pack
and a sturdy 11 hour drop in charging stand. Loaded with
firmware features and complicated to use. Two VFOs and 1200
channels in 30 banks of 40 channels each. Memory banks are
cryptically designated, though you can scan combinations of
banks. Each memory channel can be programmed with the
frequency, an 8 character label, attenuator, a skip
(lockout) flag, and mode (WFM, NFM, AM, USB, LSB, CW, AUTO).
Very slow 6 ch/sec scan rate. Rescan delay is about 1
second and cannot be disabled or changed. Auto Memory Write
stores up to 40 frequencies but does not check for dupes.
20 linkable search banks with labels. Up to 50 frequencies
per search bank can be locked out. Digital clock with
on/off timer. Battery saver can be disabled. Ability to
scan or search for signals above a selectable threshold or
channels with a specific mode. Band scope 7 or 40 steps
wide. In short, 30 - 1000 MHz sensitivity is good, few
birdies and little intermod. WFM broadcast reception very
good. The DJ-X10T squelch can be set to one of 10 levels.
We had to keep the squelch set to SQ3 or higher, otherwise
it opens at inappropriate times, especially when the battery
saver is active. The DJ-X10T instruction manual does not

specify the IF (intermediate frequency) scheme. Filters
inside the DJ-X10T imply 0.455, 10.7, and 45 MHz IFs. Our
tests indicate a first IF of 736.25 or 275.45 MHz, depending
on the frequency to which the DJ-X10T is tuned. Our DJ-X10T
hears images of cellular phone signals clearly in the 1419.9
- 1444.9 MHz range, 550.9 MHz above their actual frequency.
For a full review, including technical test results, see
Monitoring Times, November 1998.

[...]

Reprints of articles from Monitoring Times are available

In repeater systems over the past 30 years or even longer many systems
have used a series of remote receivers to relay signals for
retransmission that are "voted" for retransmission by circuits called
signal to noise ratio voters perhaps this has something to do with
this system.Phone lines and RF links relay the audio to the
transmitter sites.

Is there mods for the AOR 8200 and 7000
to restore the cellular frequencies? Or is
it just easier to order off shore?

BTW, I do like DSP radios because it will
be easier to upgrade to digital modes when
they arrive.

The Uniden 235XLT is the current popular handheld. Its clone (also made by Uniden) is the Radio Shack PRO-90. There's also the Radio Shack PRO-91, which, although it only has half the channel storage capacity of the 235XLT and PRO-90, has in my opinion a more readable display. It's also lighter.

Uniden has announced that they will be shipping the 245XLT in a few months, which will do even more than the 235XLT. It's said that the 245XLT will be able to search 2 trunked banks at the same time, or search a conventional and a trunked bank at the same time, and also search Ericssen trunked systems (the 235XLT and the PRO-90 and PRO-91 can't do this). Search for 245XLT on this newsgroup and you'll find more.

You can go to www.uniden.com. A good starting page for beginners is http://www.strongsignals.net/htm/starting.htm. The strongsignals.net site has lots of pages, like this review of my first scanner, the PRO-91, at http://www.strongsignals.net/htm/imp91.htm.

I just purchased a General Electric Model 2-920SST cordless phone with digital spread spectrum. The phone does have some background noise, but it's not objectionable. The range is good. With the "Secure Voice Scrambler" conversation protector, digital spread spectrum, and digital security system, the phone should be safe from eavesdropper, shouldn't it?

It could be they are not on a repeater. Some small towns are not on repeaters because they share the frequency with other small towns or twps.

182. Pro-51 Noisy in 800Mhz Band

Newsgroup: rec.radio.scanner
Date: 1999-02-02 00:00:00 UTC
From: dans@technologist.com
Message-ID: <796cas$h7d$1@nnrp1.dejanews.com>
Source record: 128974

Just wondering if anyone can help me out with my Pro-51...I just bought it used and everything seems to work fine but when I'm listening to the LA Fire Dept on the 800Mhz band I hear a short burst of noise every second or two while someone is keyed on, it sounds kind of like an overdriven tone...a screeching sound that eventually gets longer in duration till it drowns out the person speaking. Sometimes while scanning these freqs the radio stops on a burst of this "noise". Does not occur on other bands, and I don't hear it when listening with my BC860XLT. Reception also seem poor in the 800Mhz range. So...my question is...does this indicate there is something wrong with the radio, or is this normal for a Pro-51? Would a better antenna (better than the stock rubber ducky) help this problem?

Thanks!

Look in the local Police Call or ScannerMaster. Most agencies that have
gone to UHF or 800 have retained thier old highband channels as "Channel
2" or whatever. Others use the local government channels (Public Works).

Some could also be using the repeater output in a simplex mode. These
wouldn't be heard unless you were pretty close to the mobile unit.

This is from an older list. It's missing frequencies for Eastridge
Mall in San Jose.

Great Mall of the Bay Area (Ch. 1 Security) (Milpitas) 461.1875
Great Mall of the Bay Area (Ch. 2 Security) (Milpitas) 462.0625
Great Mall of the Bay Area (Ch. 3) (Milpitas) 463.5125
Great Mall of the Bay Area (Ch. 4) (Milpitas) 463.7375
Great Mall of the Bay Area (Ch. 5) (Milpitas) 464.0875
Great Mall of the Bay Area (Ch. 6) (Milpitas) 464.2625
New Park Mall (Newark) 464.975
Oakridge (San Jose) 464.825
Stanford (Palo Alto) 483.6875
Stanford (Phone) (Palo Alto) 461.5875
Sunnyvale Town Center (Sunnyvale) 464.975
Vallco (Cupertino) 464.525
Valley Fair (San Jose) 151.775
Valley Fair (Maint) (San Jose) 461.475
Valley Fair (Phone) (San Jose) 464.2875
Valley Fair (Security) (San Jose) 464.2875

Here's some additional Mall freuqencies for the San Jose area:

Eastridge Mall 464.475
Westgate Mall 461.9125
Westgate Mall 462.1875
Westgate Mall 463.2375

You also have an error in your list for Valley Fair (Security), it
should be 464.975 (not 464.2875, that's the Phone Patch frequency)

It seems Mr. Mackey is a professional Troll. His antics have long been an embarassment to the Amateur Radio community, and the Internet has now become his target of terrorism.

I have forwarded complaints regarding his crossposted flame war to his ISP, although he has a history of losing ISP accounts more often than most people blink their eyes... A statistic he savors like some twisted badge of honor.

Most of these flame wars started by Mackey are staged... Artificial flame wars between himself and fellow conspirators, intentionally crossposted to unrelated groups in an attempt to disrupt Usenet. For lack of a better description, Mackey is an Internet terrorist... The best we can do for now is ignore him.

Jim Baker, N9PEK
Amateur Radio Operator

>what?

You made the statement and now you complain about being called on it? Bad
language? Please you are really are reaching now. Don't start making stuff
up.

>I have a life that revolves around more than just flaming others on
>the internet - therefore I have chosen no to participate in this any

>longer.

Can't push the WinRadio so you are leaving. Bye bye.

> You may read this as defeat - ha! It seems as this forum has
>become a vehicle for undercover company representatives and
>disgruntled customers to express biased views. 73!

You still haven't denounced your connection with WinRadio. Is it your Aussie blood that got hot protecting a fellow countryman? What gives? The original poster had experience with a number of radios and reported these. YOU didn't like it but that doesn't make him a "undercover company representative" or a disgruntled customers expressing "biased views". He backed his views with personal experience and you got arrogant and pissy about it.

>frequency blocked?
>
>Grego

The rules are simple. Don't get caught.

If it IS intercepted by Customs then you will not get your scanner or your money back. Chances are, that's all they'll do, although you may end up paying a fine as well. So far, no one has ever posted that they ordered a scanner from the UK that never made it, so I'd say if you order it, it'll probably arrive just fine. But be aware of the risks before you order. You just might end up making some Customs agents day, as they usually take home the electronics they seize, rather than file a report. I'd hate to give away one of those $600 AOR's to a total stranger...

Another tip would be to ship it overnight. This gives Customs less time to see what it is. Usually the overnight shipments just get a once over by the drug and bomb sniffing dogs, and then on it goes, so unless you order an ounce or a bomb along with it, it should be fine ;-)

I've made them before. Take a piece of copper or brass tubing that's the
right size to
make connection at the positive end. Cut it the right length.
Take a piece of wood dowel the right diameter for the battery case and drill a
hole
down the center for the brass tubing. It's tough to get the hole centered, so
make it
oversize and use hotmelt glue to hold the brass in the center.
Can get all the parts at a hobby store. or hardware store or...

You can accomplish the same thing by cutting a slot down the side of the dowel

and running a wire between two thumbtacks.

There's no such thing as too much sensitivity in a receiver. There
are such things as lack of adequate selectivity, IMD and image
suppression, and adustable gain control or attenuation.

From: Goodfella99@webtv.net
Message-ID: <935-36B8DF26-7@newsd-233.iap.bryant.webtv.net>
Source record: 128749

I have a question about this.I heard that on a type 2 Moto system that when DVP is used 8 is added to the talk group? So here is an example then my question.I live in the Chicago subs and listen to Naperville TRS. The other night I heard a new TG and it was the detectives talking about suspects in a robberyTG #1840 (and was happy to hear this)The next night I seen yet another TG pop up TG#1848 but this time it was the infamous "white noise" of DVP but I kept searching all TG's.Then low and behold TG#1840 poped up again and it was a Det. asking "how the operation was going",Now this is where I get confused I heard nothing but TG#1848 lit up again.This Det.on TG#1840 then asked a few more questions and everytime I expected a response I would only "see"TG#1848 light up.It makes me think of Federal scanning I have a BC 890 with the CTCSS board installed and the DEA uses 156.7 PL ,if you don't have CTCSS on you can hear the"in the clear"talk as well as white noise of DVP so I just keep the CTCSS on and never get bothered by the wonderful sound of white noise and only hear what I can understand.So my question is If I locked out TG#1848(DVP) and only monitored the TG#1840 would I be missing anything,I would really like an answer so I,and others could enjoy our scanning a little more.Please and Thank you

Keep listening

Alpine Navigation Systems!!!

I have four gps receivers beginning with the Garmin 45.
Also own the Garmin 120, Garmin III and the StreetPilot with
six metro cartridges. Loved each one on the day I received them.
Did not take long to get dulled with their clumsiness.

The StreetPilot is the best of the Garmin line but a complete
and total waste of money if you need more than one of
Metro Cartridge. When you have to spend 500 dollars to
buy the overpriced piece of junk and then pay an average
of $125 per cartridge you will have paid for a better system
but still be stuck with Garmin.

Take a close look at the Alpine Navigation System.
I have had mine installed in my car for six months and
have never regretted the expense of this unit.

You do not have to look at the screen; the unit talks to you.

If you can not afford the Alpine unit, the next best thing
is to run your laptop with a program from TRAVROUTE called "Co-Pilot".
This software blows away Street Atlas 6 as well.

The only Garmin advantage is it's portability.

Garmin is GREEDY and their product will be short lived in
a value conscious market.

These opinions are my own personal observations. They are
extremely accurate and objective. I own every piece of
hardware and software mentioned.

He is right...Hell is not on ANY list....
Because, a so called bad word list does not exist in the FCC Reqs. Sure there was a case involving the George Carlin broadcast a long time ago. But that case never resulted in a list on bad words being placed on any FCC books.

The media says what it want's...based on what they think you want to hear/see.
The MPAA rates movies...not censor them. It is up to the producers to choose what they want to say,and what rating they think they can get.

I like the Garmin GPS III+, it has the maps
which you can down load via your PC. And
you still the tradition grid system.

Ira Sachs <irasachs@wwa.com> ...
:Alpine Navigation Systems!!!
:
:I have four gps receivers beginning with the Garmin 45.
:Also own the Garmin 120, Garmin III and the StreetPilot with
:six metro cartridges. Loved each one on the day I received them.
:Did not take long to get dulled with their clumsiness.
:
:The StreetPilot is the best of the Garmin line but a complete
:and total waste of money if you need more than one of
:Metro Cartridge. When you have to spend 500 dollars to
:buy the overpriced piece of junk and then pay an average
:of $125 per cartridge you will have paid for a better system
:but still be stuck with Garmin.
:
:Take a close look at the Alpine Navigation System.
:I have had mine installed in my car for six months and
:have never regretted the expense of this unit.
:
:You do not have to look at the screen; the unit talks to you.
:
:If you can not afford the Alpine unit, the next best thing
:is to run your laptop with a program from TRAVROUTE called "Co-Pilot".
:This software blows away Street Atlas 6 as well.
:
:The only Garmin advantage is it's portability.
:
:Garmin is GREEDY and their product will be short lived in
:a value conscious market.
:
:These opinions are my own personal observations. They are
:extremely accurate and objective. I own every piece of
:hardware and software mentioned.
:
:Ira WB9HNV

Well, I get CNN on my pager and I programmed them in myself!
All you need is the RIB and software for your model pager, and the CAPCODES
for CNN.

If you want to know what trunked systems are in your area, use the WWW.
There are lots of sites, like www.trunktracker.com. Use a search engine
and search for +trunktracker +"south carolina" or some such.
Experiment. Look around.

Seems to me this has been studied and debated to death. Agencies that are enlightened enough to not continue doing things "just because we've always done it that way" are frequently abandoning 10-codes for "plain english." But that works only if the "plain english" words all have specific meaning and usage.

As someone commented, any "codes" can cause confusion and even chaos when outside agencies are involved in any large incident.

And there are always those few odd souls who like to use codes just because they give off a bogus air of "official-ness."

And not just codes...I know of one agency in Southern California which has eliminated the word "numbers' from their radio-speak and replaced it with "numericals." As in,
"Control, please repeat the numericals on Valley Blvd for the traffic accident." And some officers will do that one better: "repeat the numerics..." Bizarre.

Then there's the agency in Northern California that's afraid to use the word "suspect;" perhaps they got sued by one once. Apparently they've overlooked the meaning of the word, as in someone who is SUSPECTED of doing whatever. Anyway, I kept hearing officers and dispatchers referring to, "The I-L left southbound..." or "Was the 'I-L' wearing a hat," or "We have the 'I-L' detained at..." Drove me nuts trying to find out what they were saying. Drove me even MORE crazy after I found out...they were instructed to refer to "suspects" as "Investigative Leads, or 'I L's" Really bizarre.

Anybody have more such nonsense? Does LASD still agonize over whether suspects are "in custody" or merely "being detained?" If you're just being detained can you walk away?

Are you sure about the trashing of his disk being caused by this? All
the info I have seen about this worm is that it has no known
destructiive effects. Dissinfection is simply a matter of replacing
the over-written files deleting added files and removing the registery
entry.

Pro 90 with the extra battery and the charging tray so you can charge both the battery in the unit and outside the unit. I bought the Uniden version and liked the Realistic because it looked nicer and traded with my buddy. So I have everything that comes with the Uniden model but have the Actual Radio Shack Scanner. It's in new condition, 9 out of a 10. Box,manual,telescoping scanner ant. Asking 165+7 for shipping. Thanks, Scott

Well, I got the "BADTIMES" virus, and then my dog was pregnant, I had contracted terminal dandruff, the paint started peeling off my house, my teen - age acne came back in force, my modem would only dial Jerry Springer`s number, And two black helicopters keep hovering close to my house. My wife then found out about my girlfriend, and they both were chasing me down the street with large kitchen knives, not to mention the fact that all my money had been donated to the national fund to put clothes on animals, my therapist died after 12 years of therapy and $50,000 in fees, and my daughter got into a car accident and now she needs a nose job really bad. My wife said when she finds me, I am gonna be a condidate for the Vienna boys choir, whatever that is, and about then I was abducted by aliens, who kept asking me "What`s the frequency, George ?" and kept shoving hot needles into my eyes.
YOU think YOU got troubles ?

231. Question about BC 200XLT repair parts

Newsgroup: rec.radio.scanner
Date: 1999-02-03 00:00:00 UTC
From: Robert Barile <rbarile@bbn.com>
Message-ID: <36B85667.2EF2@bbn.com>
Source record: 128793

I have a BC 200XLT which need a few replacement parts.

(1) Squelch Knob

(2) The top of the unit(plastic housing) where the antenna plugs in is damaged. Can that entire plastic housing piece be replaced?

(3) The display is scratched and should be replaced.

Does Uniden sell these parts? I dont have catalog or phone number.

Any advice would be helpfull.

Robert

Even if they are on a repeater, they don't necessarily have to use it.
Often times survailence teams will use the input freq. for the repeater
without sending the code to key the repeater. It allows local, unit to
unit conversation without the widespread broadcast of the repeater. Also
more difficult to pickup.

Exactly. An open-ended question with a LOT of answers, none of
which will help the buyer find the scanner that is right for
them. I suggest stopping by my Picking A Scanner/Receiver page:

http://www.strongsignals.net/htm/pickrecv.htm

> Others may have differing opinions, of course, based on their own experience.

And here they would be ;-)

Best Handheld - Yupiteru MVT-9000 M3
Best Base - AOR AR5000
Best TT - BC895XLT or OptoCom
Best Computer Controlled - OptoCom or PCR1000 (if you want HF)
Best under $500 - OptoCom

I have one of these pagers and have heard that they need to be sent to
Motorola for programming. Even the dealers can't do it. Not sure
though. Mine operates at 929.9625 Mhz. Anything else I can help with,
just drop me email.

Thanks for your respons! I checked the site and I think I probably will first try the 235. As far as I know a lot of services in the area I live use the Motorola system. Haven't heard of the use of the Ericsson system yet. But maybe I'm not looking in the right places..... Would the FCC have info on what systems are used in which region?

I currently live in SC, and they have lots to hide down here, so they probably will change to a digital system. :)

Does anyone know the availability of any "dummy" AA cells?
(I've seen them in the past - they are plastic forms the same size of
an AA cell, with a metal strip connecting the top and bottom contacts -
basically a specialized jumper!).

I have a AA battery pack for a handheld radio (Kenwood TK-250) that has
spaces for too many AA cells (excess voltage would damage radio). I need
to insert two "dummy" AA cells to act as jumpers for these extra spaces.
Already tried to solder jumpers in place - can't do it due to the metal
they used for the contacts.

Thanks for any assistance and advice!

Steve KC6IJM

How about using wooden dowels with thumb tacks in the end with wire
connecting the thumb tacks

Is the cable wired correctly with the resistor on the tip and the first ring? Try reseting the radio with button on the side. Plug the cable in with the radio OFF. Turn on pressing 3 and enter. Should say PC connect. If the data you are feeding it is bad you will most likely get an error. check the file and make sure it is formatted correctly.

Radio Shack had them in there CB handhelds a few years back. Probably go to tandy parts and order some. Try for some parts on a TRC-216 cat#21-1663. The dummy batteries were cast alumminum and were better than the plastic ones.

<19990203121513.16244.00000111@ng-fd1.aol.com>...
: Is the cable wired correctly with the resistor on the tip and the first
ring?

Yep. Continuity checks out good.

: Try reseting the radio with button on the side.

Done that. Initialized it too.

:Plug the cable in with the
: radio OFF. Turn on pressing 3 and enter. Should say PC connect.

This puts the scanner in program mode, displays 'PC PGM'.
'PC CONNECT' displays while actually transmitting data, which is when I'm
getting the '3-error'.

:If the data
: you are feeding it is bad you will most likely get an error. check the
file and
: make sure it is formatted correctly.

It won't even load the example file. I don't think this is the problem.

I'm setting up Cathy DeViney's Excel spreadsheet right now. I'll let y'all
know how it goes.

<SNIP>

OK, you must be serious about this (if not a little deluded). Think about this for a minute. If something really does happen to this guy, you are going to be prime suspect #1 - whether you really had anything to do with it or not!

Just from this post I was able to determine that your post originated from Forthnet. Now I have no interest in tracing it further, but, if pressed by someone within the FBI, these guys would most certainly give you up in a heartbeat.

See, what most people fail to recognize is that when the log on to the internet, they leave little footprints that can be traced all the way back to the IP address assigned to your machine by the server that day. And since ISP's keep logs of such events, it's very simple to trace that IP address to your login name, leading to your account information, leading to your billing address, which leads right to...you. Even most of the proxy servers and remailers people use to hide behind keep logs that can be accessed should you do something criminal (like posting a contract hit, for example - DUH!)

Your best bet is to simply chalk it up to experience and let it go at that. He ripped you off, so you'll know not to do business with him again. In fact, you can use this worldwide medium to alert the public rather than demanding his head on a platter. Put up a website, and follow up to each of his posts with the URL to it. If you give this guy enough bad press, he'll crawl back under his rock.

Just my 2 cents...

-Phil

Steve,

Have you checked at a Radio Shack? (Presuming you are located near one)

I have an old RS portable citizen's band radio that uses two dummy cells
when using 1.5V AA batteries instead of 1.2V AA rechargables. They are
a lead-like cast dummy with a thin body and normal sized top and bottom.
Perhaps they can get them for you as a replacement part ... radio is a
TRC-209, #21-1660 if that helps at all.

Try Radio Shack. Some of theeir CB walkie-talkies come with
two dummy batteries (so the user can load either ten NiCd's
or eight alkalines + two dummies). They surely don't sell
the dummy batteries over the counter, but I'd bet they can
order them as a service part for the CB W-T's. Try it!

Steve OM,

Why not just make two out of wood, with a jumper? Cost is zero.
I made a "false" battery pack for my portacle VCR and camera (no,
not a 'cam-corder'), by cutting a block of wood the same size and shape
as the sealed battery, complete with two copper contacts and leads.
This enabled me to use the setup off my cigarette lighter jack in the car.
Another zero cost solution (my favorite kind!).

73,
Don, W6JL

The Pro-91 is on sale this month for $199. I've been looking at the Uniden 235XLT but have been put off by the "battery packs" . My usage is sporatic and my experience indicates that rechargables have poor life spans if not subjected to regular use and charge/discharges. The PRO-91 has AA capability so I get to choose if I want to use rechargables or not.

But...

How does this scanner perform?

Are there any substantial flaws?

How does it compare with the Uniden?

286. URGENT: Data Decoder FAQ Update

Newsgroup: rec.radio.scanner
Date: 1999-02-03 00:00:00 UTC
From: bcheek@cts.com
Message-ID: <36b8a580.267200340@news2.cts.com>
Source record: 128864
Cross-posted to: rec.radio.scanner,alt.radio.scanner

NOTICE OF CERTAIN DATA DECODER LIMITATIONS
(and a fix!)
==========

My SCANDATA.FAQ and related periodic newsgroup
posts on data decoding attempt to define a
2 Level FSK Data Decoder Interface that will
work on a majority of all scanners.

And it does. But there are probably a few scanners
with which it won't work as designed. I just
discovered one, the Sony ICF-SC1PC. And I learned
why the 2LFSKDDI didn't work, and what to do about
it. First, the cause and why a few other scanners
may be affected.

When a known good 2LFSKDDI wouldn't work on my
Sony ICF-SC1PC, I immediately measured the RMS
value of the baseband audio signal, and much to
my dismay it was 0.150 volts (AC). Aha!

Oddly enough, that same scanner worked fine
with a 4 Level FSK Data Decoder Interface!
Of course, it has GAIN to overcome weak
signal inputs, so that was clue enough.

The baseband audio output of most scanners I
have ever measured runs from 0.350v to 0.800v,
so that's the range for which I optimized the
design of the 2LFSKDDI that I regularly post
on the newsgroups and in my SCANDATA.FAQ file.

http://ourworld.compuserve.com/homepages/bcheek/scandata.txt

Extensive tests proved that the Sony ICF-SC1PC
was not defective in any manner; it just has a
low level NFM discriminator signal. If one
scanner has a markedly low signal, then others
might, too. Here's how to find out about yours:

Connect a voltmeter (set to the AC-volts function
at a range of about 1-volts) to the baseband audio
output jack on your scanner. Tune the scanner to
a known trunked data control signal (855-868 MHz).
Record the measured voltage. If 0.350 VAC or
better, then the 2LFSKDDI as presented in my FAQ

and newsgroup posts will work just fine. But what
if the signal is less than 0.350v?

The 2LFSKDDI weak-signal fix is simple. Change
the 3.3k resistor (at U1 Pin 3 to ground) to 2.2k
if the signal is between 0.250-0.350v.

If the signal is weaker than 0.250v, then change
that 3.3k resistor to 1k. Easy as that. 1-2-3.

OPTION: You could build your 2LFSKDDI with a 10k
trimmer potentiometer in place of that
resistor, so as to make the one decoder
interface serve a variety of scanners.
A 1/4" hole drilled in the DB25 shell just
over the trip pot adjustment will let you
tweak it for optimum performance at any time.

U1 Pin 3 >----o----/\/\/\-----o----> Ground
^ |
| |
o-------/

Just wire the trim pot as a variable resistor.

NOTE: Some "data slicers" and "hamcom" interfaces
might call for a 10-k resistor in place of
my 3.3k. This only makes the 2LFSKDDI more
prone to weak-signal failure.

NOTE: Other "data slicers" and "hamcom" interface
designs go for the simplicity by eliminating
that one resistor by grounding Pin 3 of U1.
These designs might also eliminate another
resistor, too. Granted, these designs will
decode practically any level of signal......
.......including.....NOISE! The purpose of
the 3.3k resistor is to set a threshhold above
the noise for improved accuracy. So it is
essential, in my opinion. Just that depending
on the output level of your baseband audio,
the optimum value of that resistor might be
anywhere from 1k to 10k. For most scanners,
it remains 3.3k.

CAVEAT: Before going off half-cocked, make sure
there is nothing amiss with your Baseband Audio
modification. Errors and incorrect installations
can cause weak signals, too. The correct mod
has the (+) leg of a 2.2-uF to 10-uF tantalum
capacitor soldered to the NFM Discriminator audio
output pin. The (-) leg of this capacitor goes
out via a hookup wire or shielded cable to the hot

lead or center lead of the jack on your scanner
that serves as the baseband audio output. The
shell or outer lug of the jack should be grounded
to scanner ground. The shield of the shielded cable
must also be soldered to the ground lug.

If...and only if....your baseband audio mod was
properly done, and then if the signal is weaker than
0.350 VAC, you can alter the design of the 2LFSKDDI
as indicated above, for good results.

Radio Shack has a good selection of scanners, but nothing they sell nowadays can be easily modified. Almost all of RadShack's scanners are made by Uniden. If you want a modified or modifiable scanner, try your local pawn shop (or whatever they call them up North).

292. New Frequencies for Cobb Co., GA Trunk

Newsgroup: rec.radio.scanner
Date: 1999-02-03 00:00:00 UTC
From: ccreeper@inetnow.net
Message-ID: <36b8be93.7302156@news.newsguy.com>
Source record: 128870

Just to alert listeners of the Cobb County Trunk in the Metro Atlanta area, Cobb's FCC license for 6 new 800 mhz frequencies has finally been processed, and frequencies assigned, here are the outputs:

868.8250
868.4500
868.2250
867.1625
866.7000
866.1625

In addition, the County has licensed I-TAC repeaters at their 3 antenna colocation sites, here they are:

866.5125
866.0125

I would put in the TRS frequencies immediately, you should have a total of 21 output frequencies for the system when all is said and done. Check out www.inetnow.net/~creeper/scanner.htm for the news leading up to this as well as the most up to date talkgroup info.

293. which interface should I buy for 2006?

Newsgroup: rec.radio.scanner
Date: 1999-02-03 00:00:00 UTC
From: chrisjay@camalott.com
Message-ID: <798hdj$962@enews2.newsguy.com>
Source record: 128871

I am going to purchase a computer interface for my Pro-2006. I can't decide which interface to buy, the CE-232 or the OS 456lite.

I want the ability to use the scanner by itself, without having to turn on the computer.

I am leaning towards 456lite running Probe software.

If I purchase the CE-232, which software seems to offer the most for the money?

All opinions appreciated.

Thanks!

Chris

294. Help - BC 895 XLT or Wait

Newsgroup: rec.radio.scanner
Date: 1999-02-03 00:00:00 UTC
From: dgsholar <dgsholar@gte.net>

I'm looking to get the Best Scanner I can that will handle trunking.

I've heard that there is a new BC 245 coming out in May or June. My question is, should I wait, or is there another scanner out there that will do what the 245 will do now?

Is there a BASE station scanner that will do what the 245 is supposed to do?

Can anyone tell me the biggest drawback of the BC 895?

Thanks,

Dave

A friend had his hard drive trashed by a new virus out on
Jan/99, he got off a listserver.

A reformat was needed after disinfecting.

I picked it up off a listserver this afternoon but Mcafee 4.02 picked
it up and I deleted it.

It is called W32/ska or Happy99.exe

I also work for Radio Shack. I haven't personally found a CLA for the Pro-90. I took home a 12-volt positive-tip (basically a straight patch from the cig. lighter in a car to a small connector) and it doesn't seem to work for my Pro-90 for some reason. It says right on the case that it requires 12VDC positive-tip, which I gave it, and I would imagine my alternator puts out the required current ;) Who knows. As far as getting spare parts, such as batteries and AC adapters (as Mr. Kiehner mentioned), ask for the store's 'RSU Reference Manual', which is Radio Shack Unlimited (our mail order division). Look under 200-520 (which is the catalog number for a Pro-90 (20-520)). You should see a bunch of 8 digit numbers and descriptions, you can almost always get an extra battery and AC adapter for stuff we sell (where applicable). You can also order service manuals from there, and even individual IC's, cap's, resistors, etc used in the product. Sometimes you need to have a little patience with Radio Shack employees, we are not engineers, just sales people ;) And yes, that whole 'You've Got Questions, We've Got Answers' thing does get us in a lot of trouble! ;)

I have a Mint condition VX-1R w/ ADMS software & interface cable, battery, charger & antenna. I will sell for $225.

RLC Electronics COAXIAL Switch, model # s-2826
15VDC operation, N connector outputs and 1 input - $20 obo

1 - SEEKA GR40 12-24VDC input, photo/color sensor unit, very small and unused, Dark/light sens adjust - great for monitoring
object, etc - $40

1 - OMROM, NEW, H5L-A Time switch, 2 relay contacts, time set, large LCD control window, 100-220Vac supply, perfect
condition, never used, mounted in NEMA enclosure, asking $75 obo

1 - RS232 A/B printer/peripheral switch - $10

1 - Magitroni P/N I-E16-COMBO Ethernet card, BNC/RG connectors, used - $10

1 - Artsoft Ethernet Adapter, BNC/DB15 connectors - used - $10.00

1 - Moose Products Inc, High Powered 12Vdc, yelp/stdy Siren Module Board, 4 ohm min output for horn, works fine, real
loud, -
$10.00

1 - 12VDC operated UHF remote control switch receiver/Mini transmitter set, works fine, relay output (w/ relay),
transmitter
uses 12V battery, included, used but functions perfectly - $20 (pair)

Intermec (altered) Barcode Laser Scannerdevice(diode Laser) does not read, but scans fine(5V input) scans nice 670nm line
when hooked up to 5-6VDC, neat toy. - $20.00
Model # 1545

1 - B Eagle Electronics Automobile shock sensor unit, 12VDC operation with sens pot - $10

1 - DE 1506 sound automobile sensor, 12V with MIC & sens adjust $10 obo

1 - LXI series(sears) Portable 12V VCR, works fine, with all cable connections from base unit. LCD readout, no charger,takes
lead acid batteries(like from old MOTO phones - $50 obo

Uniden/Bearcat Desk model # INF5XL scanner, preprogrammed by state type, with whip antenna, no power supply, tested fine
with
mine. Buttons for POLICE, FIRE, MEDICAL, STATE, WEATHER, DELETE & HOLD, PLUS SQUELCH/VOL.

Best offer takes this off my
hands..

PRO-34 (cat # 20-139/9135) SERVICE MANUAL ONLY - $10.00

VIDEO STUFF

Casio HH calculator(scientific) # RM-7400G (icon Menu) with comp link & OHP(over head projector) unit, Calc talks to OHD via
IRDA(Infrered) signals, great for presentations/classroom. OHP also made by CASIO has some type of PCMCIA port on side
aswell, no docs, but both work fine. $100 pair

1 - Color CMOS Egg shaped CCD camera, adjustable focus, 12VDC input/NTSC video output via RCA jack - $75.00

1 - Commodore Model 1702 COLOR video monitor - $40.00

E-mail me at:

mailto:mcguyver@bv.net

Postal MO prepayment or POSTAL COD req'd. Thanks

These issues are (probably) best handled with SLICER, available at:

http://home.ica.net/~phoenix/wap/slicer.htm

Not only can you determine if data is present, and on which pins,
you can also get an idea as to the quality of the data.

Sigh..... Ya get rid of one idiot......

What is your problem dude? Do you ever post on topic? So far the only thing I've noticed about you is your tendency to pick fights and your obvious infatuation with John Mackey.

But since you seem obviously disgusted with my post, why not go into details about where we disagree rather than trying to start more crap on the NG? Can you do that "Jed"? After all that IS the key element of any discussion....

Or perhaps you prefer acting like a pompous ass....

You will need to make the cable and also have an RS-232 to TTL level converter, much like the Opto-Lynx. Bruce Pope's web page with software gives some details on cable construction. I just got my X10K and my homebrew converter using a Max232 chip and Bruce's software work great.

Just about every agency here in Phoenix refers to any female as a "101". I wonder what legal blunder started that code...

And, a phenomenon that I have noticed all over the country is officers who think 10-4 = "Yes". Every book I've ever read says 10-4 means "Message Received". Makes you wonder about their personal lives:

wife: "Did you pick up some milk?"
officer: "I heard you loud and clear"
wife: "Well? Did you or not"
officer: "I said I HEARD YOU!!"
wife: "So? Did you??"

etc.

It's dangerous (in terms of burns) to stand in the beam of one of those searchlights used for advertising purposes. That doesn't mean that it's dangerous to stand next to a 60 watt lightbulb, even though they use the same frequencies of electromagnetic radiation (light).

2.5 GHz (or any frequency) radio transmissions can burn you if the intensity is high enough. Presumably, the cordless phones don't radiate enough power to burn. There are standards for "safe" exposure levels.

Whether or not there are long term health effects from any form of radio waves not intense enough to cause burning is subject to debate.

Just thought I'd drop into the scanner group and tell folks that we now have our Grove catalog online on a secure server for ordering and all stuff we do so well over the phone! We've also added a Free Stuff section off our homepage (www.grove-ent.com) where we give away free files and frequencies that will help you in the radio hobby. Check it out!

Thanks for all your continued support and business!

Bill

Well add 17% (or is it 19%?) more to the price of the scanner for the
VAT tax.
If the price of the scanner is $500 for USA customers, the price will
be $585 or so for your relative.

Cheers!!

I have one of those also. It's been the best phone I've had for years (I've tried quite a few 900MHz wireless - last one I returned was the new Sony DSS with speakerphone/caller id. Great feature list; terrible performance and there was a pile of them returned (Xmas gifts, I think) at the store!) Every two years I take the handset apart and clean the buttons. Works like a champ!

Rocky,

There are military satellites in the 220-225 range that the 9000XLT will receive, if you have the proper antenna and a signal preamp.
Also, the US space shuttle and the Russian MIR space station sometimes communicate with amateur (ham) radio operators. Sorry, I don't recall the exact frequencies, but they're in the 147.000MHz range, which the 9000XLT will receive. Check the Amateur Radio Relay Leagues's web site for information on SAREX.
There are also some 269.00 range frequencies used by the shuttle astronauts when doing a space walk. You can receive these, but again, only with a proper antenna and a pre-amp, and only when the shuttle is passing over your part of the country.
This stuff can be done, but it takes a bit of effort and experience.

Great points Harry, although not likely to change in our lifetimes!

In flying, pilot plainspeak is defined-, "Standard Terminology". A pretty cool concept in that when standard terms are used, greater understanding (a more real definition of "communication") exists. You know to expect so when it comes it fits into that neat little box of expectation.

A Diamond or ICOM discone with Beldin 9913F cable.
Get a heavy duty tripod and a 10' mast from Radio shack.
Bolt the discone to the mast, bolt the tripod to your roof (make
sure it is level) and then slide the mast into the tripod.
Might want to tie down the cable to the mast before putting it up.
There is better cable than Beldin 9913F, BUT, LMR-400 cable (Beldin's major
competitor/Times Microwave) has a foam dielectric.
If you hare soldering your own 259 or N type connectors and have not soldered alot
do yourself a favor and use the Beldin 9913F cable instead.
9913F is the easiest Coax I've ever worked with.
Easy to cut, easy to solder.
With LMR-400 cable, if you don't know what you are doing, you will easily melt the foam
or warp the foam, changing impedance.
The only problem with 9913F is that it uses a solid dielectric instead of foam, which holds
moisture.
You will want to solder your 259 connectors to your beldin cable and then moisture seal
the ends and connectors in order to keep moisture from getting inside the cable, changing
its
characteristics.
Also, Beldin cable has to be straight to keep its proper 50Ohm impedance.
Bend beldin cable and you just changed its impedance as only cable with a foam dielectric
can keep the distance between the center conductor and outer shield the same distance on
bends,
thus keeping their characteristics.
I use LMR-400 but for a piddly .3 db less loss, the beldin cable sure the hell is alot
easier to work with
and is easier to get proper results with too.
BTW, I hear bad things about the Radio Shack discone.
I really can't tell the difference between all three Discone's I own.

338. Re: what is the difference Bearcat 235XLT vs PRO 90

David, you posted a good question. The drawback to CTCSS and multiple users under your example is that there is nothing stopping the fire group from talking on their radio while the PD is using the freq. Typically there is a busy light, but I know from experience that users don't always check the light or the volume control before they transmit. Worse case neither can be understood. Consider the following. The PD detectives want to talk to each other, while 2 fire captains want to talk to each other and the street maintainance guys are getting a call for a BO traffic light. Then what?

While trunking is a pain to track on many scanners, it solves some traffic problems. It also causes other interagency problems. Here in So California, the fire depts have gone to trunking. During a major fire along the coast, the trunking system didn't cover particulary well and they didn't have conventional UHF or VHF radios. The forrestry and other state agencies providing mutual aid, with conventional radios couldn't communicate directly with them.

At least with conventional radio systems, field service changes for emergencies could be pretty easy and the different radios worked on just about any system in their frequency range . Trunking changes are not easy, since it could involve different manufacturers with non compatible gear.

Just a thought.

Mike

Michael,

I also checked my scanner (Pro-2037) as per Bill Cheek's instruction. I can't be sure of the accuracy of my old multimeter as the AC would drift from .166 VAC (when quiet) down to .128 VAC (during a data-burst). I'm in the process of assembling the 2LFSKDDI and will start with a 1k Resistor.

I would also like to see a listing of baseband audio output measurements.

On the contrary, I use them extensively at my job and have found them to be one of the best. It all depends where you are most of the time. Inside a large concrete and rebar structure is not too good but I run a security patrol in downtown Seattle in which we are mostly outside and wow! It is supposedly very secure and looks very professional. The direct connect and phone in one cuts down on equipment. Also the dealers are great in working with companies when you buy several units.

Can someone post some frequencies for the Los Angeles area? I'm specifically looking for PD/Fire/EMS in the LA area. Thanks in advance

Well I think I am going to go with "PLAN B"

My brother-in-law conducts business once a month in London. So I will just have him purchase the unit I want and bring it back with him.

Stanford University Frequencies:

Police Channel 1 482.6125
Police Channel 2 482.8125
Fire Primary 153.770
Security/Plant Services 464.675
Security/Plant Services 464.275

Other Frequencies at Stanford University:

467.750
467.775
467.800
467.825

: (2) The top of the unit(plastic housing) where the antenna plugs in is
: damaged. Can that entire plastic housing piece be replaced?

: (3) The display is scratched and should be replaced.

FWIW, the display can't be scratched...it's underneath a piece of clear
plastic, which is what you need to replace.
Also consider buffing the scratches out(not very difficult, unless the
scratches are DEEP, in which case you can still improve the appearance of
the display window).

: Does Uniden sell these parts? I dont have catalog or phone number.
:
: Any advice would be helpfull.

they cover, are they still in print, what do they cost,
and are they available to order at a web site?

==========
QUESTIONS AND ANSWERS
==========

01: How do I restore cellular in my scanner ?

Forget it, pal. It ain't going to happen. The TDDRA of 1994
(an Act of Congress) expressly forbids the manufacture or
importing into the USA of "easily modified for cellular" scanners
after April, 1994. Manufacturers were required to remove cellular
capability from the scanners' CPUs altogether. Sorry, cellular
coverage is not possible if your scanner was made or imported after
March, 1994.

But here is a list of all those pre-1994 scanners of which I am
aware that ARE capable of cellular restoration:

PRO-2004 BC-855XLT *3 Regency 4030
PRO-2005 BC-200XLT Regency 1600
PRO-2006 BC-205XLT
PRO-2022 BC-760XLT *4
PRO-2026 *2 BC-700XLTA *4
PRO-2027 BC-890XLT *4
PRO-2030 BC-950XLT
PRO-2032 BC-2500XLT *3

PRO-34
PRO-37
PRO-39
PRO-43 *1
PRO-46 *2 *5
PRO-51 *2
PRO-23 *2

Note 1: Date of Mfg code 1A4, 2A4, xA3, xA2 (label in battery compment), or no "A" in the serial no.

Note 2: Date of mfg code 1A4, 2A4, -A3, -A2 (label on back).

Note 3: Date of mfg code must not end in the letter "D", except for OAID.

Note 4: Date of mfg code must not end in the letter "D".

Note 5: Units with date code of 5A4 can tune cellular in 30 kHz Steps using a keyboard entry sequence.

For instance, PRO-43's imported before March, 1994, are modifiable, while some brought in during March and all thereafter are impossible to modify. Date codes of any -A2 or -A3 and only 1A4 and 2A4 are assured of being modifiable. 3A4 and up probably aren't.

The above list does not include those scanners that were naturally capable of receiving the full 800 MHz band, without modification. The below list of radios had relatively continuous coverage that includes cellular:

J.I.L. SX-400 Yaesu FRG-9600 AOR-8000 *
Regency MX-4000 AOR-950 Icom R-7100 *
Regency MX-5000 AOR-1000 Icom R-1
Regency MX-7000 AOR-1500 Icom R-100
Yaesu FRG-9600 AOR-2500 Icom R-9000
Kenwood RZ-1 AOR-3000 * Icom R-7000
Uniden BC-800XLT

* pre-1994 only

Some of these radios, if still current, had the cellular removed by the factory after March, 1994. There may be possibilities of restoring cellular in later models of the AR-8000, AR-3000, and ICOM radios by replacing an EEPROM or reprogramming one, but that is beyond the scope of this FAQ, and in general, should not be considered feasible.

==========
02: What about cellular restoration ads for post 3/94 scanners?

Yes, I used to see magazine ads to "restore" cellular or to "unlock 800 MHz" in newer scanners. Gasp! This is almost a deception. See, these ads were for the "VD" mod.

Virtual Downconversion - better than a venereal disease, but not by much. To my way of thinking, it is an inferior method of "unlocking" the cellular bands because:

A. They're not really unlocked. VD is a trick of turning off one oscillator and turning on another. Typically, they set the scanner to the 400 MHz band, and then turn off the normal 400 MHz Local Oscillator and turn on the one for 800 MHz to make cellular receivable on the 400 MHz display.

B. There is no logical correlation between the actual cellular frequency and the displayed frequency. It varies from one radio to the next, but suppose 880.000 MHz comes in. It might be received/ displayed on 432.6775 MHz. Duh....??

C. The full cellular bands of 823.950-849.000 and 868.950-894.000 are not available by this method. In fact, only a small part of one or the other (often not both) is available, like maybe 10-20 MHz of the total.

D. There is no 30 kHz stepping. You're limited to the default CPU "rules" for the band in which the cellular appears, typically 5 kHz or 12.5 kHz.

E. The exact results of the VD mod, generally described above, depend on the scanner. Results vary from one to the next. None are what I'd call "good" or even acceptable.

The good thing that can be said for the VD mod is that it is the ONLY way to get any cellular at all from post March-1994 scanners. So, the advertisements that you may have seen are not exactly "fraud".....but you sure don't get much.

==========
03: Are any mods available for my scanner ?

You may have the wrong impression about scanner modifications and hacking. Mods are not "available" in the sense that they can be found on a store shelf, or laying on the top of someone's mind who can tell you in so many words or less how to turn that a Snakebite X101 scanner into a fire-breathing, rip-snorting behemoth of a TurboWhopper.

All scanners can be modified for something; generally a dozen or more things. But only a few scanners have anything written about them in detail. And you have to know where to LOOK. You can't just up and ask for "mods".

Well, you *can*, but you won't get a substantive reply.

It takes me several days to several weeks and sometimes
MONTHS to work up and write about a hotshot mod for a
decent scanner, and after THAT level of effort, it's not
possible to make it "available" off my fingertips. Continue
reading below. There are answers to your question.

==========
04: What mods do you have for my scanners?

I wish I knew what people mean by: "what mods do you have..."
I don't "have" mods, exactly.....

I wrote three books and eight years worth of the monthly WORLD
SCANNER REPORT that feature mods for a variety of scanners.
With over 900 scanners ever marketed, I don't pretend to cover
them all.....just, a fraction.

Many of "my mods" can work with most any scanner.... but there is
no way I can write explicit instructions for more than the bench
models on which I develop mods. I can and do offer hints on
how to apply these mods to other scanners but again, not having
the scanner in front of me and not having the Service Manual,
there is little I can do other than hint.

I have to leave it to the user to study the published materials
and then ask specific questions to which I am happy to provide
specific answers...if I can. That's about as good as it gets.

You are strongly encouraged to thumb through my books and through
the back and current issues of the WORLD SCANNER REPORT to see
what interests you and to pick topical material from which you
can phrase specific questions that have possibilities of reply.

As it is, all I can say at this point is that DOZENS of mods are
possible for your scanners, but I have to leave it to you to do
the legwork and research. And when you have specific questions,
then I can answer them.

==========
05: Can you send me "the mod" for my scanner?

Well, what is "the" mod? There are dozens of possible mods
for your scanner. Regardless, the answer in general is no, I
don't "send" mods. I have published hundreds of mods for various
scanners and other radios in my books; in the monthly World
Scanner Report, and some as text files on my Web and FTP sites.
You can exhaust these resources to your heart's content.

Due to the overwhelming flood of requests for this kind of
information, I can't do personal and custom research. There just
isn't time in the day for that workload. If it's free info you
want, try looking up scanner Web and FTP sites. If you don't mind
paying for better quality info, then try books and magazines.

You can also try the Usenet REC.RADIO.SCANNER newsgroup where modification information is sometimes published. It's free if you have a connection to the Internet and a Usenet reader/editor program.

==========
06: Where can I find mods for my Brand-X scanner ?

Mostly you can't. There are only a handful of scanners ever made that were worth focused research and development. Those scanners include:

PRO-2004 PRO-2005 PRO-2006 PRO-2035 PRO-2042
PRO-2022 PRO-43 PRO-34 PRO-37 BC-200XLT
PRO-26 PRO-39 BC-3000 PRO-64 PRO-2041

You can find occasional articles and files on "mods" for other scanners not mentioned above, but they are the exception to the rule. Start by looking up scanner Web and FTP sites, and peruse their quick-links to other sites:

Many scanner Web Sites have quicklinks to dozens of other sites that may contain a file or two on generic "Snakebite" scanners. But don't get your hopes up.

Now here is the problem: I am one of the few, (if not the ONLY) engineers seriously committed to scanner mods.

Yet, there are around 1000 scanners on the historical list now. It is physically impossible for people like me develop hacks for any but a few. We have to choose among the more popular scanners, you see....certainly the ones that interest us. Now what scanners do you suppose engineers and technicians will find "interesting"? Not many, pal.... not many.

The above list of scanners reaches out to tens or hundreds of thousands of owners. There is no time left to work on generic "SnakeBite" scanners that have little to offer, even after hours of hard work! But take cheer and read on.....

==========
07: So you mean there are no mods for my scanner ?

More or less I mean that, but, that's not to say yours can't be modified. It can! It's just that there is nothing published for it; nothing in the way of step-by step instructions with graphics, photos, and details.

No one would go to the time and trouble, you see? The preponderance of published hacking information is for those scanners listed in Question 05 above. Other scanners just aren't interesting enough for professional investigation.

An engineer who is capable of designing super-hacks for that "SnakeBite" scanner isn't going to own one! Instead, he will own

one in the Question 05 list, one that is eminently capable of
some very powerful modifications in the first place.

Now I said your "SnakeBite" can be hacked. It can.

But you are more or less on your own in the sense that you can't
be directed to a "shopping list" of mods from which you can pick
and choose. There is no such list. Any hope for you is to first
figure out what you want to do, and ask specific questions.

I can give you a few answers in advance:

No.

No, your scanner is likely not capable of cellular; scanners made
or imported after March, 1994, are not cellular-capable. Most scanners
are not likely to be capable of extra memory; additional frequency
coverage; and things of that nature that pretty much require factory
design in the first place. (See ahead for Memory Modifications)

Yes.

Yes, your "SnakeBite" may be capable of certain mods, a few
of which include the following: (You wanted a list?)

1. Tape Recorder Jack
2. Automatic Tape Recorder Switch (beats VOX!)
3. Extended Delay
4. Tone Decoder-Rejector Countermeasure
5. CTCSS mod
6. S-Meter
7. Scanner-to-Shortwave Interface
8. Carrier-On-Indicator
9. Audio Improvements
10. Beep volume or disable
11. Squelch Improvements
12. Remote Controller
13. Discriminator output for data decoding
See Question 18 - this can be done to all scanners
14. Event or "hit" Counter
15. Shielding of plastic cases
16. External DC power
17. Improved Adjacent Channel Rejection
18. Speed up of SCAN & SEARCH modes
19. Back light modifications

Then, maybe...depending....on the scanner.... the following
digital and/or esoteric enhancements.....???

20. Interfacing to a computer
21. Subsidiary Carrier (SCA)
22. Extended Memory to 25,600-channels & up
23. 54-88 MHz restoration

24. Data/Tone/Noise Rejection
25. Trunk "Tracking" - maybe.
26. Cellular restoration (See Question 01)

==========
08: So how can I do some of these mods?

That's a problem. No one has written them up for any but a few scanners. About the only way I can think of is to get one or more of my three books and a subscription to the WORLD SCANNER REPORT. Research and study up on the mods we've developed for other scanners, and then compare the procedures for that specific scanner to yours. Often, when I write up a mod, I give hints on how to apply it to other scanners.

Also, if you ask me *specific* questions, I can give specific answers. If you ask "how to do a memory mod", I'll have to refer you to something already in print or published somewhere. If you are doing a memory mod and run into trouble, then I can help you with that trouble.

==========
09: Memory mods? How can I increase the programmable channels?

That depends on what kind of memory storage is used by your scanner. There are three kinds:

1. On-board CPU RAM (Random Access Memory)
2. Static Random Access Memory (SRAM)
3. EEPROM Electrically Erasable Programmable Read Only Memory.

The first kind is most prevalent and there is no way to expand that kind of memory. It is, however, usually limited to scanners with 50 channels or less of programmable memory. 100-channels and up are usually done by methods 2 or 3. So your first step is to determine what kind of memory is used by your scanner.

EEPROM memory is expandable, but very difficult under most circumstances. SRAM is the easiest and offers the largest expansion capabilities. For example, the PRO-2004, PRO-2005, and PRO-2006 can be expanded to 25,600 programmable channels (and more)! The PRO-32, PRO-34, PRO-37, PRO-39 & PRO-2022 can go to 12,800- channels and beyond. The BC-760XLT, BC-560XLT, and a few others can be taken to 6,400 channels and more. The PRO-2035 and PRO-2042 can be taken to 16,000 channels and beyond. The PRO-2041 and PRO-64 are good for upwards of 25,600 channels.....

My Extended Memory Modifications are amply documented in excruciating detail in my books and in the WORLD SCANNER REPORT, complete with diagrams, photos, and many pages of instructions such that most casual hobbyists who know a soldering iron from a tire iron can do the work. This kind of mod is not suited to being given out in an e-mail or a forum message in so many words

or less. You will need to acquire the instructions before doing the work.

==========
10: How do I tell a SRAM chip from an EEPROM from CPU RAM?

If you can't do this on your own or after the below explanation, you are probably not a candidate for such a wild adventure at this stage of your hacking career.

Most CPUs hold a small amount of RAM (random-access- memory), sufficient to store anywhere from 10 to 50, maybe a hundred channels or so. This is the case for most scanners, so there is no way to increase that memory. Fortunately, there are two other methods of RAM used by a few scanners that offer possibilities for expansion.

EEPROM: The least common and least expansive is EEPROM (electrically erasable programmable read-only-memory). The PRO-43, PRO-26, BC-2500XLT, BC-200XLT, BC-100XLT and BC-3000XLT, for example, use EEPROM programmable memory. It is possible to expand EEPROM-types of memory, though not by such huge proportions as the SRAM type. EEPROMs are usually tiny little chips with 8-pins.

SRAM: A handful of scanners use a separate SRAM (static random-access-memory) chip for storage of frequencies and custom channel settings. It is this type of memory that can be easily and economically expanded by factors of 2, 4, 8, 16 and even 64 times the original volume! Scanners known to employ SRAM memory include the following:

PRO-2004 PRO-2021 PRO-32 BC-760XLT
PRO-2005 PRO-2022 PRO-34 BC-950XLT
PRO-2006 PRO-2032 PRO-37 BC-590XLT
PRO-2035 PRO-2041 PRO-39 BC-600XLT
PRO-2042 PRO-64

There may well be other scanners that use SRAM memory, but either I forgot about them or don't know. If you're curious about your scanner's potential for memory expansion, you can just about forget it for those with fewer than 100-channels. The CPU's RAM easily handles 10 to 100 channels or so. If your scanner is not on the above list, but has 50 or more channels, then look over its schematic diagram and parts list or scrutinize its Logic/CPU Board for any of the following types of SRAM chips:

uPD446G-15 TC-5517CF-20 LC-3517BM-15
CXK5864BP MB-8416-20LPF BR6265BF HY6264

or something similar, disregarding the last few digits and letters. An SRAM chip is generally characterized by a rectangular shape with 24 to 32 pins, each of the longest sides holding half

the pins. An SRAM chip in a schematic diagram will be characterized by eighteen or more of its pins going straight to the CPU chip. Any chip with less than 24-pins is not likely to be an SRAM; neither is any chip in a square format. SRAMs are rectangular (DIP or SMT) with 24 to 32 pins. Pinout notations of SRAM chips will include mystic codes such as:

A0, A1...A9, R/W, CE, I01, I02...I08, OE, etc.

==========
11: My scanner has an SRAM; how do I do the mod?

Get the published instructions for Extended Memory Mods. These instructions are much too detailed to include as basic text files, and in most cases, the articles are copyrighted anyway. Start by reviewing my free Table of Contents and Index to the World Scanner Report where you will find articles on memory mods. Get at least one of my books to supplement the WORLD SCANNER REPORT. The ULTIMATE SCANNER book is a good choice.

The Table of Contents and Index to the World Scanner Report can be found on my Web and FTP sites. They're also contained in my product information file: PRODINFO.ZIP

I can send these files by e-mail upon request, or they can be downloaded from my Web and FTP sites.

Since all SRAM chips are much alike, my instructions for one scanner generally apply to all, and are not too difficult to follow, provided you can find the SRAM chip in the first place.

==========
12: Do you do scanner modifications like memory mods?

Sure. Contact me privately and we can go from there. One note, though: I don't do cellular mods anymore. The FCC has gotten persnickety about that sort of thing. In general, I don't do speedup mods anymore because they cause more problems than the speed increase is worth.

==========
13: I'm not interested in all your mods - just one. Will you photocopy the information for me?

Not if it's in a copyrighted publication. My publishers own the copyrights to my books and my company owns the copyrights to material published in the World Scanner Report. It would be unethical, illegal, or both, for me to make copies.

If your budget is tight, you can in many cases get basic information for free from Web and FTP sites. The real good stuff generally comes only in books, magazines, newsletters, and such, like Popular Communications, Monitoring Times and the World Scanner Report. It is not always necessary to buy information

in order to do mods. On the other hand, the published mods are NOT the low degree sort of thing you find on BBS's and Internet sites with a few sentences or paragraphs and maybe an ASCII drawing if you're lucky.

My mods are detailed and well documented with graphics, including schematic diagrams, photos, and illustrations. This kind of work can't come for free, though.

On the other hand, there may be no cost if all you want are the simple mods like the cellular mod to the PRO-2006.

==========
14: So how do I restore cellular in the PRO-2006?

1. Remove the top cover of the scanner.

2. Look down inside the front panel behind the #3 key of the keyboard, and clip the exposed leads of the two coppery colored diodes standing on end. One restores cellular and the other gives a FREE 25% speedup of the SCAN function.

3. Replace top cover.

See, that's the kind of stuff that comes for free.

==========
15: How can I install the military aero band in my scanner?

You can't, and that's that. If your scanner didn't come with the military aero band (220-400 MHz), then there is no way under the sun of "restoring" it. You can't restore what ain't there.

==========
16: How can I modify my scanner to follow trunked systems?

That depends on your scanner. So far, the only scanners that can be "modified" to follow trunked conversations are the PRO-2004, PRO-2005, and PRO-2006. And then, it's a bit more than just a "mod". It's also a process, a method, and a bit more. If you're interested, see:

http://ourworld.compuserve.com/homepages/bcheek/trunk.htm

Otherwise, you can't, not exactly. Each trunked system is as different as night and day with respect to other trunked systems, even from the same vendor.

It is possible for the hobbyist to gain some skill and fortitude in following trunked system conversations. These techniques are scattered around in various written works, from books, magazine articles, and prefaces in frequency directories...to text files on various BBS's and Internet archives. These techniques, hints, tips, and kinks cannot be recited here in so many words or less. One good starting point might be the preface material in any

recent edition of Radio Shack's POLICE CALL books. But in a word, you cannot alter "a scanner" to follow trunked signals.

Uniden's and Radio Shack's TrunkTracker series of scanners are specifically designed to follow Motorola trunking systems.

There is some interesting software appearing around the Internet these days....that may be useful in trunk following. Check out these web sites for interesting possibilities if you don't want to cough up for a Uniden or Radio Shack TrunkTracker:

http://web2.airmail.net/lblant1/dfw/digital.htm
http://www.geocities.com/CapeCanaveral/Lab/1060/beta.htm

See Question 18 for more info on this possibility.

==========
17: Can my scanner be interfaced to a computer for remote and automated control, as well as for programming of the memory channels by the computer? Can the interface acquire data from the scanner and send it to the computer?

In a word, yes. Many scanners "can" be interfaced to a computer for one-way control and automated programming of the memory channels. These scanners include:

PRO-2004 PRO-2005 PRO-2006 PRO-2035 PRO-2042 PRO-2041
PRO-2022 PRO-34 PRO-37 PRO-39 PRO-43 PRO-26
PRO-64

Probably quite a few others are possible - most, really.

There are three scanners that are capable not only of the one-way mode of remote control and automated programming, but also of a "data acquisition" mode where the scanner sends its display (channel, freq, bank, mode, delay, lockout) and other data to the computer for automated logging and data processing. These scanners are the PRO-2004, PRO-2005, and PRO-2006.

Several companies make scanner/computer interfaces, including Optoelectronics and COMMtronics Engineering.

Each interface has its own unique characteristics, advantages, and limitations, but all are "good" in the sense of freeing the operator from much of the labor and drudgery of scanning. The Optoelectronics interfaces are generally limited to the PRO-2005/6 & PRO-2035/2042.

A "roll your own" computer interface was published in the World Scanner Report, V2N1-V2N6. Another more powerful one was published in my 3rd book, THE ULTIMATE SCANNER (Cheek3).

COMMtronics Engineering's CE-232 Scanner/Computer Interface is in its fifth year and continues to be a front-runner and state of

the art. For more info:

http://ourworld.compuserve.com/homepages/bcheek/

ftp://ftp.cts.com/pub/bcheek/ce-232

John Montalbano KA2PYJ, seems to have designed a nice
one-way interface and control software. I can't vouch
for it, but go to the following URL and see for yourself.

http://www.qsl.net/ka2pyj/

==========
18: What's a 'discriminator output' and a 'data slicer'

Ahhh, I'm glad you asked. This one is hotter'n a $2 pistol
these days. For gory details, including detailed instructions
on how to take advantage of this hot, new interest, see my file
or regularly posted newsgroup article with the SUBJECT:

"Scanner Data Decoder FAQ" SCANDATA.FAQ

DISCRIMINATOR OUTPUT
====================

But to answer your question in so many words or less,
every scanner has a Discriminator, a circuit usually
little more than a chip, the purpose of which is to
detect narrow band FM (NFM) signals. NFM is the mode
most commonly used above 30 MHz, whether for voice or
data transmissions. Regardless, if it's an NFM signal
of any type, the Discriminator converts that signal into
audio. It's low-level audio, but nevertheless audio.

If it's a voice signal, you'll hear and understand it
as this signal out of the Discriminator gets filtered
and amplified up to speaker volume levels. If it's a
data signal, well you'll hear that, too, but you won't
understand it. Data signals are raucous, nasty sounds
that'll send you scrambling to hit the SCAN or arrow
keys mighty quick.

BASEBAND AUDIO
==============

Unless, of course, decoding that data is among your interests. If
it is, then there are a couple more things you need to know. First,
this Discriminator Output signal is also known as the "baseband
audio". The chief characteristics of the baseband audio are
(1) low level, typically .2-.8 volts, AC), and (2) unfiltered.

Unfiltered? Well, yes. See, the human voice band is considered to
be 300 Hz - 3000 Hz. Signals above and below that range are not
considered essential to the successful transmission of voice, so to

simplify the design of the audio preamplifier and power amplifier in the receiver, and to cut down on noise and hash, cheap and simple filters are used to eliminate signals below and above that band. And for voice, it's no big deal. All communications receivers, including scanners have some kind of voice band filtering between the output of the detector/discriminator and the headphones or speaker.

DECODING DIGITAL DATA
=====================

Trouble is....data signals, especially high speed data above 2400-bits/sec (bps), have a bandwidth somewhat wider than the voice band. This simply means that you cannot successfully decode high speed data by tapping the signal off the speaker or headphone jacks. You have to take the signal for decoding right off the output of the Discriminator. Therefore, since decoding data is getting to be interesting and of wide appeal these days, you'll hear a lot of talk about "discriminator outputs" and "baseband audio taps"; one and the same thing.

DATA SLICERS or DECODER INTERFACES
==================================

Last, but not least, in order to decode data signals, you need a bit of extra hardware and some software. The software is more fully discussed in my regular article titled SCANNER DISCRIMINATOR DATA. The extra bit of hardware that's needed is referred to as a "data slicer" or, as I call it, a "Data Decoder Interface".

The Input of this decoder interface or data slicer is fed from the scanner's Discriminator Output. The Output of the decoder interface goes straight to one of the computer's COM or serial ports. Fire up the computer and the software; turn on the scanner and tune in a data channel, and you're in business.

For a circuit diagram and construction details, as well as how to identify and locate the Discriminator in your scanner, see my regular newsgroup article titled SCANNER DATA DECODER FAQ. That'll get you started on the cool, neat, fun world of decoding digital data off the airwaves. You can also get the file from my FTP site:

ftp://ftp.cts.com/pub/bcheek/faqs/scandata.faq

==========
19: How can I build a 'data slicer'?

Detailed instructions for that are in my FAQ file called SCANDATA.FAQ that's regularly posted on the scanner newsgroups and available for download at my FTP site:

ftp://ftp.cts.com/pub/bcheek/faqs/scandata.faq

==========
20: What if I don't want to build a 'data slicer'?

There isn't much of a technical obstacle to "rolling
your own Data Decoder Interface, but if lack of time,
tools, or access to the parts is an obstacle, then you
can acquire one in either of two ways:

8-pg Instruction Set (only) $5 ppd, $7 foreign

1. Kit of essential parts (you build it): $15 + $8 S&H

Includes:
3 ea Capacitor; tantalum; 10-uF/16v:
1 ea D-sub Plastic Hood/shell; DB25
1 ea DB25 connector; female; solder pin
2 ea Resistor; 100-k; 1/4-watt
1 ea Resistor; 3.3-k; 1/4-watt
4 ea Diode; silicon; 1N4148
1 ea Op-amp; LM741CN; 8-pin DIP
1 ea Perfboard; pre-cut, notched, trimmed to size
1 ea Shielded cable; 3-ft; w/RCA plug
1 ea Detailed printed instruction set, complete with
graphics, photos, tables, and "what if's"...
1 ea 3.5" floppy disk w/shareware & freeware decoder
programs and utilities.

Optional upgrade or add-on items:

* A. Shielded cable; 6-ft; w/RCA plug + $2.00
* B. Shielded cable; 12-ft; w/RCA plug + $4.00
C. Port Adapter; DB25 male-to-DB9 female + $7.50
(adapts 25-pin Interface to 9-pin comport)

* Instead of the standard 3-ft cable w/RCA plug

-=OR=-

2. Assembled/tested Decoder Interface $40 + $8 S&H

Includes:
1 ea Data Decoder Interface built into a DB25 shell
with standard 3-ft shielded cable w/RCA plug.
1 ea Detailed printed instruction set, complete with
graphics, photos, tables, and "what if's"...
1 ea 3.5" floppy disk w/shareware & freeware decoder
programs and utilities.

Optional upgrade or add-on items:

A. Built with 6-ft shielded cable and RCA plug + $2.00
B. Built with 12-ft shielded cable and RCA plug + $4.00
C. Port Adapter; DB25 male-to-DB9 female + $7.50
(adapts 25-pin Interface to 9-pin comport)
D. Custom enhancements/designs per your specs +$10/up

TO ORDER: Use e-mail, fax, or postal mail per the
information in my signature box below.
MC/VISA or M.O. preferred. Personal and
company checks okay, but shipment delayed
until bank clearance. No COD's and no
shipments to PO Boxes or mail drops. Alaska,
Hawaii and foreign shipping extra.

TERMS: All sales are final; no returns-no refunds.
30-day Performance Warranty on the Assembled/
Tested Decoder Interface is strictly limited to
Motorola SmartNet trunked data signals using
TRUNKER.EXE Repair or replacement at our
option during that 30-day period. No
warranty on Kits.

==========
21: What books have you written, generally what topics do
they cover, are they still in print, what do they cost,
and are they available to order at any web site?

BOOKS
=====
Scanner Modification Handbook, Vol-1, ISBN 0-939780-11-9
Scanner Modification Handbook, Vol-2, ISBN 0-939780-14-3
The Ultimate Scanner (Cheek3) ISBN 1-56866-058-8

Available from leading mail order radio dealers everywhere
as well as many radio shops and electronic supply houses.
Cost depends on the seller and I can't speak for them.

MONTHLY NEWSLETTER

354. CTCSS vs. Trunking

Newsgroup: rec.radio.scanner
Date: 1999-02-04 00:00:00 UTC
From: David Schoenberger <dtscho@mail.wm.edu>
Message-ID: <uO9u2.3161$007.7699896@firenze.visi.net>
Source record: 128697

A general question about frequency allocation:

I understand that trunked systems were developed because of a demand for frequencies. Trunked systems do not give one agency exclusive rights to a frequency, and thus allocation is more efficient. Trunking is therefore an excellent concept.

But before trunking was developed, it seems that there was already a way to get better use of a frequency. What about one frequency for an organization with different CTCSS tones for each group within the organization? Police could use one tone, fire another, etc. This would allow 38 users, or talkgroups, to use a single frequency.

CTCSS was technology that was in place before trunking, and so there would have been no reason to build a separate infrastructure. Trunking does offer some advanced computer control features, but I'm sure many organizations could have done without them. If multiple tones on the same frequency had become the standard, think how much easier scanning would be!

Just a thought...

Dave

Bill Cheek's Scanner Data Decoding
Frequently Asked Questions File
============================================

Contents
=========
```

01: What is a 'Discriminator Output' and 'baseband audio'?
02: How can I find the Discriminator Output in my scanner?
03: How do I connect to the Discriminator Output?
04: How do I build or acquire a SIMPLE decoder interface?
05: How do I build or acquire a BETTER decoder interface?
06: So how do I decode digital data from the airwaves?
07: How can I decode CTCSS, DPL, and DTMF from the airwaves?
08: Is it possible to "TrunkTrack" without a TrunkTracker?
09: What if I don't want to build my own Data Decoder Interface?

Questions and Answers

==========
01: What is a 'Discriminator Output' and 'baseband audio'?

There is a growing interest in tapping the baseband audio out of various scanners for decoding of a variety of esoteric signals, including CTCSS, SCA, FSK, RTTY, FAX, Pager data, and trunked system control data, etc.

By and large, such signals cannot be taken from TAPE REC jacks, headphone jacks, and EXT SPEAKER jacks because of the voice-band filters that are between the signal source and these output jacks.

Therefore, it is necessary to tap the wider "baseband audio" directly at the output of the NFM discriminator chip in your scanner. This is the first step to successful data decoding from the airwaves.

==========
02: How can I find the Discriminator Output in my scanner?

Table 1 shows a list of scanners, the discriminator chip(s) used in the scanner, circuit symbols of those chips, and the baseband audio (discriminator output) pin.

If your scanner isn't listed in Table 1, then refer to Table 2 to find its discriminator chip. The chips listed in Table 2 are all known Discriminators used in scanners and wide coverage receivers.

Between Tables 1 and 2, you should be able to find the NFM discriminator and its output pin for any reasonably modern scanner.

Corrections and additions to these lists are requested. See my email and other addresses at the end of this file.

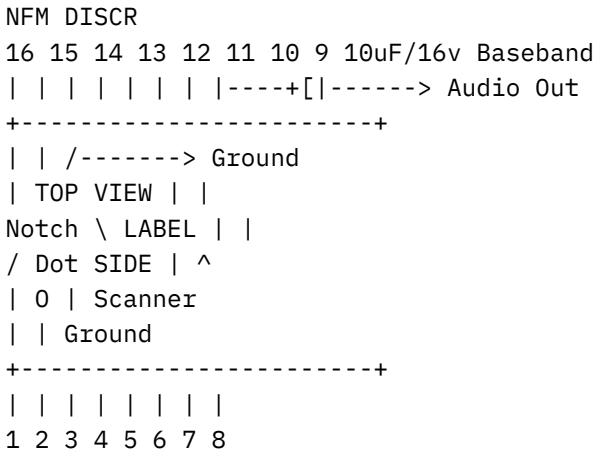
Once you locate the discriminator in your scanner, you have to make its output conveniently available on the exterior chassis, much like a headphone or tape recorder jack.

Figure 1 below shows how to determine the pin numbering system for most integrated circuits. Looking at the marking side of the chip, there is either a notch or nook at one end, and/or an embedded "dot" off to one side at one end. The notch, nook, or dot signifies the end that starts with

Pin #1 and ends with whatever the highest numbered pin
happens to be. Most IC's have 8, 14, 16, or 18 pins.

FIGURE 1
TYPICAL NFM IC CHIP PINOUT



NOTE: Figure 1 shows the baseband audio tap on Pin 9,
though the pin number will vary from one chip
to the next.

==========
03: How do I connect to the Discriminator Output?

HOOKUP PROCEDURE
==========

If you need the raw NFM Discriminator baseband audio signal
for external purposes, the best way to access it is via a
jack installed in a convenient, unobtrusive location on the
scanner. Use Figure 1 as a general guide.

1A BASE SCANNERS: Install an RCA or other jack in a desired
place on the scanner's external case, typically the rear
panel.

1B HANDHELD SCANNERS: If you can find the space, use a
standard monaural 1/8" phone jack or a 3/32" mini phone
jack. Some scanners are so cramped inside that even
these won't fit. In that case a strip of 3 pinline
sockets can be melted into the plastic case and wires
soldered to the inside protrusions.

The middle pinline socket is not connected to anything;
it's just there as strength and support for the pinline
plug you make, with the shield ground soldered to one
end and the audio- center soldered to the other end:

GND---o o o---NFM DSCR (audio)

"Break-apart" pinline plugs/sockets are available from
Mouser, DigiKey, and Hosfelt.

Digi-Key: p/n A208-ND (800) 344-4539
Hosfelt: p/n 21-274 (800) 524-6464
Mouser: p/n 151-5520/5530 (800) 346-6873

These little puppies are good for a lot of hacker needs,
so get a supply!

2. Connect the shell or outer frame part of the jack to
scanner chassis ground. (Use one end socket for pinline
connections)

3. Connect the (+) leg of a 10-uF tantalum capacitor (Radio
Shack #272-1436) to the Discriminator output Pin. (Capacitor
should be tantalum, but can vary in value from 2.2-uF to
10-uF at a voltage rating of 16-35 vdc.)

4. Connect the center conductor of a shielded coax (RG-174,
etc) or shielded mic cable to the (-) leg of the
capacitor. NOTE: if the distance from the NFM tap to the
jack is less than 3", then a single unshielded hookup
wire will do fine.

5. Connect the shield of the cable at this end to a nearby
PCB ground trace or spot.

6. Connect the center conductor of the other end of this
cable (or single hookup wire) to the center or hot lug
of the jack.

7. Connect the shield of the cable at that end to the
ground lug of the jack.

8. Fabricate or buy a shielded patch cable with one end to
mate with the new jack on the rear of the scanner at
that end....and the other end to mate with whatever jack
is on the tape recorder, processor, decoder, or whatever
device is to be connected at the other end.

Now you are ready to connect a data decoder interface to the
baseband audio output jack. See Figure 1 above.

==========
04: How do I build or acquire a simple decoder interface circuit?

If you want to decode trunk control, MDT, some pager, fax and/or
other digital signals, you will need to build or buy a simple
2-Level FSK Interface to go between the NFM Discriminator/
Baseband Audio of the scanner and a standard PC serial port.

See Question #5 for a more sophisticated 4-Level FSK Interface.

If you are not capable of building your own, or if you
don't have the time to mess with it, I can supply either

a Kit of all essential parts and detailed instructions,
and you build it yourself, OR I can supply an assembled/
tested Decoder Interface, built inside a DB-25 shell and
connector with a 3 ft shielded cable terminated with an
RCA plug. See Question #9 for details.

The DB-25 shell connects directly to a DB-25 comport on the
PC, or, if your comports are DB-9's, you can get a
DB25-to-DB9 adapter for it. You should, however, be able to
make your own following the below instructions.

This is a tried and true Data Interface circuit that's good
for everything we've tried, including a wide variety of
scanners. External power is not required. This circuit
draws its power from the comport. It is similar to the
"Hamcom" and "data slicer" interfaces, but is optimized for
more scanners and more applications.

2-LEVEL DATA DECODER INTERFACE SCHEMATIC DIAGRAM

Gnd RxD
COM3
or other
port for Trunk
Follower control
```

LEGEND:

```
|
--o-- = soldered connection/junction
```

```
--o = turn of the trace in the drawing
|
```

```
--|-- = crossover (no connection)
+|[ = capacitor, polarized (note the +)
>| = diode (anode->|-cathode)
|< = diode (cathode-|<-anode)
-/\/\/- = resistor
-->>> = ground
```

NOTES:
1. Use tantalum capacitors, +|[polarity as shown

2. Radio Shack's LM-741 op-amp works fine. Others might not!

3. Use 1/4 or 1/8 watt resistors to conserve space

4. Build circuit on a trimmed and fitted piece of perf board inside a DB-25 shell for max efficiency and space savings. DB-25 connects to PC's comport and a shielded cable from the scanner goes to the input; shield is ground and center is audio.

Hi-res laser printed Instruction Sets available with precise schematics, drawings, perfboard layout, graphics, wiring, and solder points. Inquire: bcheek@cts.com or see:

http://ourworld.compuserve.com/homepages/bcheek/decode.htm

5. Many handheld scanners have no space to install a phone jack for the NFM Discriminator Output. For such tight spaces a strip of 3 pinline sockets can be melted into the plastic case and wires soldered to the inside protrusions. The middle pinline socket is not connected to anything; it's just there as strength and support for the pinline plug you make, with the shield ground soldered to one end and the audio-center soldered to the other end:

GND---o o o---NFM DSCR (audio)

6. For base scanners, install a female RCA jack on rear panel.

7. For handheld scanners where there is space, use a 3/32" mini or a 1/8" standard monaural phone plug.

8. 3.3k is an optimized value for most scanners. If the baseband audio output measures less than 0.350-V AC, with a voltmeter set to AC-volts at a 1v range, you should decrease the 3.3k resistor to 2.2k, or even 1k if if the measurement is under 0.250v AC.

I measured 0.150v AC out of the baseband audio tap in a Sony ICF-SC1PC handheld scanner. The required resistor from U1 Pin 3 to ground worked out to 1k.

The NFM baseband audio signal of most scanners should show 0.400v AC or higher, in which case the 3.3k resistor is just right.

9. Connect the interface to a comport on the PC. Plug the input cable in to the scanner's NFM Discriminator Output Jack. Tune to a desired signal and run the decoder software of your choice.

10. If you are interested in using the "data decode" scanner to control or "TrunkFollow" a second scanner, then run a pair of wires off the Data Decoder Interface from unused TxD (Pin 2) and Ground (Pin 7) out the back of the circuit. This pair of wires will feed the RxD and Ground pins of another COMport on the PC.

==========
05: How do I build or acquire a BETTER decoder interface?

First, understand that you may not need or want a "better" decoder interface. The 2-Level Data Decoder Interface given just above is ample for most everything except "FLEX" and ReFLEX" pager signals. There may be other exceptions, but they are few and far between. In most cases, the simpler 2-Level FSK Data Decoder Interface will be all you need.

Secondly, understand that the more sophisticated 4-Level FSK Data Decoder Interface cannot and does not replace the simpler 2-Level version. If you want the 4-Level interface, that's fine, but you'll need the 2-Level, too.

If you are not capable of building your own, or if you don't have the time to mess with it, I can supply either a Kit of all essential parts and detailed instructions, and you build it yourself,

OR

I can supply an assembled/ tested 4-Level Data Decoder Interface, built inside a project box with a DB-9 output jack on one end and an RCA jack on the other end. You will need to provide your own shielded cable terminated with an RCA plug on one end to mate to the box and whatever connector on the other end to connect to the NFM Discriminator Baseband Audio Output on your scanner.

You will also need to provide a shielded straight-thru 9-cond serial cable with a male DB9 plug on one end to mate to the 4LFSKDDI box and whatever connector on the other end to mate to the chosen PC serial port.

You may also have to provide your own +/- dual polarity power supply. (Two 9v batteries can suffice.) See Question #9 for more details.

I'm not sure yet how to present the 4-Level FSK Data Decoder Interface circuit as a plain ASCII schematic like shown above for the simpler 2LFSKDDI circuit. So for now, I have to refer you to the Web Sites that support this circuit with graphics, text, and/or software support. You should research these sites:

http://www.geocities.com/SiliconValley/Horizon/6063/
http://www.qsl.net/pa3eik/4lev_fsk.htm
http://www.geocities.com/CapeCanaveral/Launchpad/4039/
http://www.geocities.com/CapeCanaveral/Launchpad/4039/PINFO.HTM
http://www.geocities.com/CapeCanaveral/Launchpad/4039/IINFO.HTM
http://www.geocities.com/CapeCanaveral/Launchpad/4039/POCFLEX.ZIP
http://www.geocities.com/ResearchTriangle/Lab/9339/
http://www.geocities.com/SiliconValley/Network/8916/4levelm.gif

I now have available a detailed Instruction Set on the 4LFSKDDI for those who find the above sites a little too technical to handle. I can also provide Kits of essential parts, less enclosure and power supply. See Q&A #9.

==========
06: So how do I decode digital data from the airwaves?

First, you tap the Discriminator Output in your scanner. Then build the desired Data Decoder Interface and connect it to the Discriminator Output. Then connect the other side of the Decoder Interface to a com/serial port on your PC. Lastly, run the software that decodes the particular type of signal that you want to decode.

In general, it takes different software for different kinds of signals, and I can't possibly cover them all here. I will suggest that you start out with a free program called TRUNKER that decodes the control data of Motorola trunking systems. This is one of the easiest to set up and get working; therefore, it makes a good test "platform" to prove up all your work before you

venture into bigger and better things. Motorola trunk systems are fairly common now.

TRUNKER and a good set of documentation and limited support for it can be found at the following Web Sites:

http://www.geocities.com/CapeCanaveral/Lab/1060/beta.htm

or

http://web2.airmail.net/lblant1/dfw/digital.htm

Apparently it is possible to decode certain kinds of data from the airwaves without a decoder interface - just software! For info on decoding MDT signals with nothing more than a Windows PC and a sound card, check out:

http://www.geocities.com/ResearchTriangle/Facility/7646/

==========

07: How can I decode CTCSS, DPL, and DTMF from the airwaves?

That is strictly up to specialized hardware and/or software that kind of goes beyond the scope of this FAQ. Lots of software is out and about that will do it, and there are even possibilities for "roll your own" hardware decoders.

But the first thing you'll need is the "baseband audio" output that is described in Questions/Answers #1-3 above. The Data Decoder Interface described in Q/A #4 is good ONLY for trunking and pager types of data; not CTCSS, DPL, and DTMF, unfortunately.

In fact, it takes specialized hardware and/or software to decode each of CTCSS, DPL, and DTMF; and each is as different as night and day.

Some scanners come equipped for CTCSS decoding, but most do not. And none come equipped for DPL or DTMF that I know of.

For more information about retrofitting CTCSS and DPL decoders to your scanner, contact:

Communications Specialists, Inc.
426 West Taft Avenue
Orange, CA 92865-4296
(800) 854-0547 Fax (800) 850-0547
(714) 998-3021 Fax (714) 974-3420
WEB: http://www.com-spec.com/

For a low-cost "roll-your-own" DTMF Decoder (hardware) there is a nice project done up in great detail in one of the back issues of the monthly WORLD SCANNER REPORT

newsletter, V3N10. Backissues are always available at a nominal cost. See:

ftp://ftp.cts.com/pub/bcheek/products/prodinfo.zip

There are other hardware and software solutions for decoding DTMF that I may include here later as I get the information verified and added.

The WiNRADiO Digital Suite is awesomely capable of decoding CTCSS and DTMF. See: http://www.winradio.com

For scanners in general, though, it all starts with a tap to the "baseband audio" point, so read over Q&A 1-3 above for the details.

==========
08: Is it possible to "TrunkTrack" without a TrunkTracker?

It didn't used to be, but times do change and YES! It is now possible to track the trunks without a 'real' TrunkTracker Scanner, and better, for that matter!!!

Like the other subjects in this FAQ, it all begins with a Data Decoder Interface. See Q&A #4 and Note 10 in that answer for the tiny extra addition you need to make to the Decoder Interface.

Next, you need a PRO-2004, PRO-2005, or PRO-2006 scanner, although we hope to add other scanners to the list in due time. For now, it's one of those three.

NOTE: It is possible to track the trunks with a AR-8000 and perhaps with one of the Opto Interfaces, but these are specialized situations where detailed info must be found elsewhere.

Then you need a CE-232 Scanner/Computer Interface (or its predecessor, the HB-232). You will also need the hot, new Windows program for the CE/HB-232 called Pro-Turbo.

Lastly, you need one fairly modern computer, Pentium 133 or better, for the easiest way to track the trunks, but there is another way almost as easy, if you have two computers, one a 486DX2/66 or better and the other, a PC-386 or better.

There are other requirements, too, but the above are the main ones. It is beyond the scope of this FAQ to spell out all the details, but the V8N9 issue of the monthly World Scanner Report tells it all. You can order this or any other back issue of the World Scanner Report since Jan-91, including 6-mo and 1-yr subscriptions.

You can also download a more detailed text file on
TrunkFollowing with the PRO-2004/5/6 from my FTP site at:

ftp://ftp.cts.com/pub/bcheek/ce-232/trnkscan.txt

For more information on the Pro-Turbo software for the
HB/CE-232, contact:

Paul E. Turton
RR # 3; Wainfleet, Ontario Canada L0S 1V0
E-mail: pturton@iaw.on.ca or jabba@iaw.on.ca
Web: http://www.iaw.on.ca/~jabba/pro-turbo.htm

For more information on the CE-232 Interface, you can
download a file called PRODINFO.ZIP from:

ftp://ftp.cts.com/pub/bcheek/products

or you can view and download all the individual files
from the \CE-232 directory. Or, you can ask for it as
an e-mail file attachment from: bcheek@cts.com

or see the information in my signature box below.

But yes, it is now possible to track the trunks without
a TrunkTracker scanner, and do it better than any of the
"real" TrunkTracker scanners! The cost can be a lot
less than the cost of a real TrunkTracker, too. The cost
largely depends on what you already have, or can
scrounge up, but at worst, it's well within the budget
of many scannists.

==========
09: What if I don't want to build my own Data Decoder Interface?

See further below if you are intested in a 4-Level Data
Decoder Interface. First is info on the 2LFSKDDI:

2LFSKDDI
========

There isn't much of a technical obstacle to "rolling your
own 2-Level Data Decoder Interface, but if lack of time,
tools, or access to the parts is an obstacle, then you can
acquire one in either of two ways:

NOTE: We can supply the 2LFSKDDI detailed Instruction Set
alone for $5, ppd, USA and $7, ppd, foreign.

1. Kit of essential parts (you build it): $15 + $8 S&H

Includes:
3 ea Capacitor; tantalum; 10-uF/16v:
1 ea D-sub Plastic Hood/shell; DB25
1 ea DB25 connector; female; solder pin
2 ea Resistor; 100-k; 1/4-watt

1 ea Resistor; 3.3-k; 1/4-watt
4 ea Diode; silicon; 1N4148
1 ea Op-amp; LM741CN; 8-pin DIP
1 ea Perfboard; pre-cut, notched, trimmed to size
1 ea Shielded cable; 3-ft; w/RCA plug
1 ea Detailed printed instruction set, complete with
graphics, photos, tables, and "what if's"...
1 ea 3.5" floppy disk w/shareware & freeware decoder
programs and utilities.

Optional upgrade or add-on items:

* A. Shielded cable; 6-ft; w/RCA plug + $2.00
* B. Shielded cable; 12-ft; w/RCA plug + $4.00
C. Port Adapter; DB25 male-to-DB9 female + $7.50
(adapts 25-pin Interface to 9-pin comport)

* Instead of the standard 3-ft cable w/RCA plug

-=OR=-

2. Assembled/tested 2-L Decoder Interface $40 + $8 S&H

Includes:
1 ea Data Decoder Interface built into a DB25 shell
with standard 3-ft shielded cable w/RCA plug.
1 ea Detailed printed instruction set, complete with
graphics, photos, tables, and "what if's"...
1 ea 3.5" floppy disk w/shareware & freeware decoder
programs and utilities.

Optional upgrade or add-on items:

A. Built with 6-ft shielded cable and RCA plug + $2.00
B. Built with 12-ft shielded cable and RCA plug + $4.00
C. Port Adapter; DB25 male-to-DB9 female + $7.50
(adapts 25-pin Interface to 9-pin comport)
D. Custom enhancements/designs per your specs +$10/up

4LFSKDDI
========

CAVEAT: It may be illegal to decode certain 4LFSK signals.
You must determine that for your self and cease
interest in the subject if not legal in your area.

If you are intested in a 4-Level FSK Data Decoder Interface
we have a detailed Instruction Set ready to go, as well as a
Kit of Essential parts, less enclosure and power supply.

Assembled and Tested units are not ready yet, but.....I may
have available some built/tested prototype units that have
been proved fit for consumption.

One or more of the following may be available:

1. Instruction Set Only - you build from it.
8-pages of hi-res laser printed text, charts,
photos, drawings, and detailed, hand-holding
guidance: Price: $5, ppd, USA; $7, ppd, foreign

2. Kit of Essential Parts, plus detailed Instruction Set
from (1) above, less enclosure and power supply. See my
4LFSK.FAQ file for details, or the following web site:

http://ourworld.compuserve.com/homepages/bcheek/4lfsk.txt

Price: $20 + $8 S&H, USA; $20 + $15 S&H foreign

3. Kit of Essential Parts, incl power supply. Price: TBA
4. Assembled/Tested 4LFSKDDI, less power supply. Price: TBA
5. Assembled/Tested 4LFSKDDI, incl power supply. Price: TBA

TO ORDER: Use e-mail, fax, or postal mail per the
information in my signature box below. MC/VISA or
M.O. preferred. Personal and company checks okay,
but shipment delayed until bank clearance. No
COD's and no shipments to PO Boxes or mail drops.
Alaska, Hawaii and foreign shipping extra.

TERMS: All sales are final; no returns-no refunds. 30-day
Performance Warranty on the Assembled/ Tested
Decoder Interface is strictly limited to Motorola
SmartNet trunked data signals using TRUNKER.EXE
despite that it will work on many other kinds of
data, too. We just can't support it all. Repair
or replacement at our option during that 30-day
period. No warranty on Kits.

Not responsible/liable for illegal use of this
information and/or these products; nor for any
consequences thereof. You must determine
lawfulness of these products for your applications
and region and not use them, if illegal.

Use of this information and/or these products is
100% exclusively at your own risk.

You must determine suitability and fitness of
purpose of these products to your needs. I will
not accept responsibility or liability for any
damage or loss that results from use of these
products, nor for damage or loss that results from
connecting these devices to a scanner and/or a
computer.

You must determine all risks and accept all
consequences of any damage to hardware and/or data
stored in the computer.

==========

That's it for now. I will keep this FAQ updated. If you see things that need to be added to it, by all means, let me know. If this FAQ fails to address your question(s), then hit me with 'em again, but be specific. And be detailed with symptoms and observations if you need tech support on mods or troubleshooting and diagnosis. Use e-mail.

"Dan" <n7wpd@xxmission.com> wrote:

> I wonder if there are any posted mods for this new Sony scanner?
> What about a discriminator mod for trunking/paging?

Pin 9 of IC-401....located on the bottom
side of the upper board. Good luck getting
there. But.......

An easier access is a solder spot about 1/4"
to the left of RV-401, and an inch to the right
of L409, on the top side of the upper board.
All you have to do is remove the rear case
to access this spot. It's the only solder spot
in the vicinity I described, aside from grounds.

Here --> o |RV401|
| L409 | /
|
|
| o Ignore these
| | o
\ \ |
| ||
| ||

CAVEAT: The baseband audio signal level is weaker
than in.most scanners, about 0.150v AC. This
isn't strong enough to drive some "data slicers".
For a solution, see my recent post,

Subject: URGENT: Data Decoder FAQ Update

and all will be well.....

If you live in the San Diego area, your best bets would be Gene Hughes' original POLICE CALL (Southern California edition), and MetroScan. I doubt that ScanFan exists, but if you ever see any ScanFan books, I recommend those as well.

> dtscho@wm.edu

Think of a line at a bank teller window. If you have a single line for
all 5 tellers, the next available teller takes the next customer in line.
If you have 5 seperate lines, you get to chose your teller, but if he gets
a difficult customer ahead of you then you wait longer.

Apply this to trunking now. A trunked system allows you to grab any
available channel, and queues you up for one if there is no available
channel right now. A PL/CTCSS system will allow multiple departments share
a common channel without listening to each other (a major function of
CTCSS) but you still can have only one user at a time, and if your channel
is busy you either have to find a vacant one (and somehow tell your party
to change channels) or wait. A trunked system does this for you, finds a
vacant channel and automaticly tunes your radio and anyone else you need
to talk to will be on the chosen channel.

Both systems have their ups and downs.

In the 235xlt discript at http://www.usascan.com/
it says:
You can enhance your national, state and local security preparedness
by being able to continuously monitor conversations even though the message
is switching frequencies. Not compatible with AGEIS, ASTRO, EDACS, ESAS and
LTR systems.

What do the abreviations mean and is it to say that the unit is
uncapable of them ?

Body handling: Inline uuencoded payload not displayed: ATT00030.gif

Here is the description for the 235xlt but I am not that knolagable of the pro 90 so it doesn't mean much

BC235XLT TRUNKTRACKER 300 Channel Scanning Radio
The Industry's First Trunk Tracking Scanner

The Bearcat TrunkTracker BC235XLT is the worlds first scanner capable of tracking a selected radio transmissions as it moves across a trunked radio system. Now its easy to monitor fleets and subfleets in analog trunked radio systems. The BC235XLT can also work as a conventional scanner. This 300-channel, programmable handheld scanner provides scanner users with uninterrupted monitoring capabilities of Type I, II, IIi and hybrid trunking systems. One of the biggest obstacles in coordinating emergency response has been the increasing use of trunking radio systems in business and public service agencies throughout the U.S. and Canada. This makes it nearly impossible to track a conversation as it moves within a trunk system from frequency to frequency. During a disaster, its essential to be able to monitor response agencies for proper coordination. You can enhance your national, state and local security preparedness by being able to continuously monitor conversations even though the message is switching frequencies. Not compatible with AGEIS, ASTRO, EDACS, ESAS and LTR systems.

Features:

a.. New Selectable Attenuator - Eliminates annoying intermodulation from adjacent frequencies in highly populated areas. If youre near an unusually strong signal source, the signal may overload the scanner. Your scanner may stop repeatedly on that frequency and miss other transmissions. When the attenuation feature is on, the incoming signal strength is attenuated (reduced) by about 15 dB. This prevents unusually strong signals from overloading the scanner. In the Trunking Mode, press the ATT button. You will hear a beep and the decimal point in the display begins flashing, indicating the attenuation feature is on for all channels. To turn it off, press the ATT button again and the decimal stops flashing. Older software versions of the BC235XLT do not have the attenuator feature.You can tell you have the new version if ATT is printed above the decimal point. The Radio Shack PRO 90 and PRO 91 Trunktracker scanners do not support this essential feature.
b.. 300 Channels - You can program each of these memory channels to store one frequency.
c.. 12 Bands, 10 Banks - Includes 12 bands with Aircraft and 800 MHz plus Service Scan. Ten banks of thirty channels are useful for grouping similar frequencies and selectively scanning these groups.
d.. Pre-Programmed Service (SVC) Search - This feature allows you to

toggle through police, fire, emergency, aircraft, marine, and weather frequencies.
e.. Trunk Scan and Scan Lists - Scan for activity on one trunk group or create lists of multiple groups to scan like police, fire, emergency, etc.
f.. Trunk Search - Search for and monitor all the groups within a trunked system. Lockout unwanted groups during the search and save other groups to scan lists.
g.. Trunk Lockout - Lockout groups you dont wish to monitor, (including data groups) from the trunked system.
h.. Trunk Delay - Apply a five second delay to trunking groups so that both sides of conversations can be heard, even if the trunking frequencies change between replies.
i.. CRX120 Battery Charger - Allows you to keep this included spare battery charged at all times.
j.. 10 Priority Channels - Keep track of activity on your most important channels while monitoring other transmissions.
k.. Manual Channel Access - Go directly to any channel without stepping through other channels.
l.. Memory Backup - Retains frequencies entered more than 3 days without batteries or during a power failure.
m.. Programmable Search - This feature allows you to find new frequencies in any of the bands.
n.. Channel Lockout Key - This feature allows you to skip over channels you dont currently want to hear.
o.. Two Rechargeable Ni-Cad Battery Packs - Includes two rechargeable nickel-cadmium long life battery packs. Each battery pack will supply up to 10 hours of use.

Specifications:

Channels
300 Channels (30 Channels x 10 Banks)
(20 Channels Search Skip-Memory)
(20 Channels Service Scan Skip-Memory)

Frequency Range
29 - 29.7 MHz (10 Meter Amateur Band)
29.7 -50 MHz (VHF Low Band)
50 - 54 MHz (6 Meter Amateur Band)
108 - 136.9875 MHz (Aircraft Band)
137 - 144 MHz (Military Land Mobile)
144 - 148 MHz (2 Meter Amateur Band)
148 - 174 MHz (VHF High Band)
406 - 420 MHz (Federal Government Land Mobile)
420 - 450 MHz (70 cm Amateur Band)
450 - 470 MHz (UHF Standard Band)
470 - 512 MHz (UHF T Band)
806 - 956 MHz (Public Service Except Cellular Band)
162.400 - 162.550 MHz (.025 increments) (WX Channels)

Display

372. Discriminator voltage levels

Newsgroup: rec.radio.scanner
Date: 1999-02-04 00:00:00 UTC
From: Michael Paull <mpaull@mpx.com.au>
Message-ID: <79bpcb$gs2$1@news1.mpx.com.au>
Source record: 128715
Cross-posted to: alt.radio.scanner,aus.radio.scanner,rec.radio.scanner

Hi.,

As per Bill Cheeks scanner data decoding faq I decided to measure
the voltage level of my scanners discriminator output. Going by the faq you
should expect, with your scanner tuned to a valid trunk data stream, a level
of around 350mV, although some scanners are known to output much less (down
to 150mV).

My AOR AR-1000 and Uniden Bearcat 220XLT both measure approx 180mV on a
trunk data stream.

Purely as an excersize of interest i'd be interested to know what other
readers scanners measure. The faq seems to suggest that the higher reading
is more standard, and I wonder why two scanners of different makes with
difference discriminator chips give the same reading. My system gets a 100%
error free reception according to trunker and POC32, and still works very
will on noisey pager and trunk freqs.
I've built both the "All-in-one" and PD204 based 2level slicers and each
provides the same results, excellent!

However I am wondering how having the lower level might affect the newer 4
level decoders, as I would like to try and decode rd/lap and re/flex.

Anyway, it would be interesting to see a list of other users scanners and
the voltage levels the discriminator outputs provide.

Regards,

Mike

ps. if you haven't seen the faq here's the url

http://ourworld.compuserve.com/homepages/bcheek/scandata.faq

I have a Mint condition VX-1R w/ ADMS software & interface cable, battery, charger & antenna. I will sell for $225.

RLC Electronics COAXIAL Switch, model # s-2826
15VDC operation, N connector outputs and 1 input - $20 obo

1 - SEEKA GR40 12-24VDC input, photo/color sensor unit, very small and unused, Dark/light sens adjust - great for
monitoring
object, etc - $40

1 - OMROM, NEW, H5L-A Time switch, 2 relay contacts, time set, large LCD control window, 100-220Vac supply, perfect
condition, never used, mounted in NEMA enclosure, asking $75 obo

1 - RS232 A/B printer/peripheral switch - $10

1 - Magitroni P/N I-E16-COMBO Ethernet card, BNC/RG connectors, used - $10

1 - Artsoft Ethernet Adapter, BNC/DB15 connectors - used - $10.00

1 - Moose Products Inc, High Powered 12Vdc, yelp/stdy Siren Module Board, 4 ohm min output for horn, works fine, real
loud, -
$10.00

1 - 12VDC operated UHF remote control switch receiver/Mini transmitter set, works fine, relay output (w/ relay),
transmitter
uses 12V battery, included, used but functions perfectly - $20 (pair)

Intermec (altered) Barcode Laser Scannerdevice(diode Laser) does not read, but scans fine(5V input) scans nice 670nm line
when hooked up to 5-6VDC, neat toy. - $20.00
Model # 1545

1 - B Eagle Electronics Automobile shock sensor unit, 12VDC operation with sens pot - $10

1 - DE 1506 sound automobile sensor, 12V with MIC & sens adjust $10 obo

1 - LXI series(sears) Portable 12V VCR, works fine, with all cable connections from base unit. LCD readout, no
charger,takes
lead acid batteries(like from old MOTO phones - $50 obo

Uniden/Bearcat Desk model # INF5XL scanner, preprogrammed by state type, with whip antenna, no power supply, tested fine

with
mine. Buttons for POLICE, FIRE, MEDICAL, STATE, WEATHER, DELETE & HOLD, PLUS SQUELCH/VOL. Best offer takes this off my
hands..

PRO-34 (cat # 20-139/9135) SERVICE MANUAL ONLY - $10.00

VIDEO STUFF

Casio HH calculator(scientific) # RM-7400G (icon Menu) with comp link & OHP(over head projector) unit, Calc talks to OHD
via
IRDA(Infrered) signals, great for presentations/classroom. OHP also made by CASIO has some type of PCMCIA port on side
aswell, no docs, but both work fine. $100 pair

1 - Color CMOS Egg shaped CCD camera, adjustable focus, 12VDC input/NTSC video output via RCA jack - $75.00

1 - CCD B&W board camera, w/ adjustable lens, 12Vdc input, Video (NTSC) output - $50 obo

1 - Commodore Model 1702 COLOR video monitor - $40.00

Anybody know if it is possible to use&log ACARS from Nuuk - Greenland ?

Any "real-life" testing done ?

Any comments are very welcome

TIA
Stephan

"Government agencies" can. I suppose that that means federal, state, or local agencies. I have heard of people at these agencies getting ahold of official letterhead to purchase "restricted" items, but I'm sure that I wouldn't be able to recall that in a court of law.

,and you say it's cheaper anyway

387. 2.4 GHz cordless phone safe?

Newsgroup: rec.radio.scanner
Date: 1999-02-04 00:00:00 UTC
From: "Vijay S. Bajwa" <vbajwa@iscp.bellcore.com>
Message-ID: <36B9B394.2781@iscp.bellcore.com>
Source record: 128730

This may sound like a dumb question, but my concern is real (anyway these sort of things are only discovered years later). Being that your friendly microwave uses 2.4GHz waves to cook food, and that it IS considered dangerous to stand around it if there's significant leakage, how safe is it to use a phone next to your face, which is emmitting and receiving similar waves?

The reason I'm even considering a 2.4 GHz phone, is for the features the panasonic models offer.

Thanks!

The the database works fine(for me)when selected from options. I am running a P233 w/ 64mb ram under Win95B.
The frustrating thing is that it doesn't allow you to toggle back and select another frequency. You must exit the database and then go back into it under options. Frustrating when you have multiple freqs to look up. Also, the database seems a bit weak. My company has 12 800Mhz and 27 900Mhz licenses and NONE of them come up when I enter them. How lame

The only one I know of is the 80 channel Mod:

1) open the radio up
2) on the key pad board remove the metal shield
3) look at the the large IC chip and you see the number one (1) right under the one you should see two solder contacts
4) Bridge those to contacts and WOOHOO you now have 80 channels!!

i recently read a page about modifying a bc700a. there were 2 different mods on the page. the first was "remove the center resistor maked, '472' on the PCB board, behing the copper panel in the very front of the scanner". i gave a diagram, and i followed it. I have basic knowledge of electronics, so i knw i did that right. on power up, i did not recive cellular band(870-890, or somewhere in there). So, i tried a different mod. this one stated to place a jumper on pad xx... anyway, it was near the diode i removed..
i did this correctly, and at the end of the letter it said to "cycle the power and you'll recieve the full 8-900 meg spectrum" well, i am not. can anyone help me out here?

thanks

406. The Pro-91 cell mod claim !

Newsgroup: rec.radio.scanner
Date: 1999-02-04 00:00:00 UTC
From: scanshack@aol.communicate
Message-ID: <19990203211625.07682.00000366@ng-fz1.aol.com>
Source record: 128779

Concerning the guy selling the Pro-91 on ebay who claims he took 3 months to figure out the cell mod for it. I e-mailed him and asked him to share but he wanted to keep it to himself. I can respect that. But I would suggest we wait until it is sold and e-mail the winner of the bid. He can confirm the cell mod story and let us know if in fact it now does receive the 806-956 MHz range with no blocks as advertised. If it does then thats great for Klem3056BT@aol.com who is selling it and discovered the (for now unconfirmed) mod. He may have broken a Radio Shack secret !!!

Joe & Jim,

You do realize, of course, that if on your return to the states the customs officer finds your trunk loaded down with illegal scanners the penalty for smuggling those is the same as for smuggling cocaine, don't you? While listening to cordless and cellular is illegal it is treated on first offense as an "infraction," and not a felony or even misdemeanor. No such luck with smuggling. Booze, cigarettes, Cuban cigars, drugs or scanners, it's all treated the same, if you're caught.

NO!
Overnight by courier, results in the courier company filing the
customs paper work, and they are legally required to notify customs of
contraban in the declaration. I'd rate the odds on seizure as much
higher with overnight. With Air Parcel Post from the UK, if it weighs
less than 4 pounds, the odds on someone EVEN LOOKING at the customs
declaration are close to zero!

411. Re: RS Pro-91 Any good?

>
>How does this scanner perform?

Very well, from my limited experience with it.

> Are there any substantial flaws?

The display model I tested seemed a bit slow on scanning, but very fast on
searching.

>How does it compare with the Uniden?

I believe it is made by Uniden for RS. I have never used the 235xlt.

Well, down here in Georgia the local PD doesn't call them "warrants";
instead they are "wants" (with a twang, no less!) It comes out sounding like
this:

Officer: "614 to 911 dispatch, license number is xxx-xx-xxxx"
911: "Comes back to a Joe Blow, 123 Idiot Lane, Pooptown, GA, Class C is
valid, no wawnts"

Makes us Southerners sound so stupid...

From: Michael Derryberry <mderryberry@netxn.com>
Message-ID: <DNyu2.827$D_.7558@newsfeed.slurp.net>
Source record: 128550

I have several scanner antennas on the roof and my favorites are 2 made by Antenna Specialists. They are the MONR31 and the MON-58. they are both good for 25-1000mhz. The difference is the MONR31 is better for low band as it has larger radials. The MON-58 is better for 800mhz as it has what A/S calls a "Micro-Choke". I have bith on the roof and am very pleased with them.

I like them better than discone antennas. They seem to out perform my discone hands down. As for find them, if your local scanner/ham radio store doesn't have them, any commercial radio shop can order one for you.

Don't forget to use good quality coax, it's not worth it to try and scrimp and save a few cents on coax. Spend a few more dollars and you will be forever happy.

Hope this helps ...

Mike Derryberry

>Well add 17% (or is it 19%?) more to the price of the scanner for the
>VAT tax.

It's is 17.5% :-(

As you say he would have to pay the VAT if it is purchased in the UK but
it is possible to reclaim this (the VAT) if he is a Non UK (EC) resident
by completing a VAT407 form, this is provided by the dealer. On
departure from the UK this needs to be stamped by UK Customs to prove it
was exported and on return to the dealer (via post) the VAT can be
refunded to a Credit Card (or however) at a later date.

Cheers,
JC

Follow the "Manuals" and grab the AR2001 pdf file. Its not the original
manual but certainly has the details that should get you going. The
AR2001/MX-5000 didn't have the 800-1300MHz coverage but all operating
functions are the same.

FRS does cause headaches for GMRS users. Mainly the FRS unit will
momentarily open GMRS recievers and repeaters. I experience this problem
with the Motorola mobile in my van a couple times a week.

Rich,
Is there a date code or serial number that a user will be able to tell if it is a pre or post mod version R10 ?
It's a very tough mod to do and one that could make the radio just a paper weight if not done right. It would be bad to risk an attempt on a version that could not be modded anyway only to be successful at your micro-soldering work and find no expanded frequency.

:is the BC80xlt modifiable?

There are many mods that can be done to the BC80xlt.
Of course the list is greatly reduced if you want the unit to
remain working.

Mod #1. Place unit in middle of traffic lane during peak traffic.
Mod #2. Throw unit off bridge.
Mod #3. Place unit in bucket of water for two hours.
Mod #4. Open up radio and remove CPU.

:Thanks in advance!

Source record: 128569

Steve,

I'm not sure that you want to try one antenna to cover 12mhz to 1,200mhz.
Most broadband 'scanner' antennas only cover down to about 25mhz. You may
want a second antenna (like a long wire) for 12mhz to 30mhz.

I use the Diamond discone and am impressed with it's construction. It
seems to work very well though I have no particular test equipment to verify
that. I would think the ICOM would also be well made.
I did seal my antenna with a spray acrylic to keep out the moisture and
hopefully prolong it's life.

And like the other post'ers said, don't scrimp on the coax. Not much good
if you have a fine antenna and lose half the signal getting it from the
antenna to the radio.

Alan,

When my county PD (Cobb - GA) first went to a trunked system, it was no big deal. It was just like searching the previous discrete frequencies, except of course I couldn't just stop on any particular zone. Most of the time I didn't want to stop and listen only to one zone because then I'd miss the traffic on the other frequencies.

SO - At first, trunking was no big deal because only the Cobb PD was using it. Now, however, we're a couple of years down the road and the county trunking system is used by, the fire department, the sheriff, the water works, the road department, the bus system, animal control and who knows who else. Now it's not a matter of being able to listen to the police calls, it's a matter of being able to TUNE OUT the other garbage. A trunking radio would allow (assuming it's got the right features) me to tune in or tune out those 'virtual' channels. I may keep my newly acquired Pro2042 and use it for discrete services and get a Trunk Tracker just to use for the county trunking system.

No I didn't. Not quite sure how this got missatributed, but wanted to
set the record straight.

I haven't had a single problem with my VTech, which I've had for a
year and a half.

To those who *have* had keyboard meltdown, how old was the phone when
it happened, and when was the phone purchased? Since mine has been
flawless thus far, I'm trying to see if this is something that maybe
only affected earlier phones?

Sorry to post this again. I'm not sure if i did succesfully make the post earlier the other day - or perhaps I just got no reply :-)

But here it goes again:

1) Could it be possible to rx ACARS when living in Nuuk - Greenland ?

TIA

Regards Stephan

HI all,

I have a Sony WaveHawk ICF-SC1PC handheld scanner for sale/trade.
25-1300Mhz and 300 channels, pc programmable and controlable.

$300 or trade for Yaesu VX1-R

Dan

I always wondered how California police started using 'X' for female.
Some hidden inhibition?

10-15, 19 with two, one is an X.

Coming to the station, arrested two, one is a female.

Sounds so strange!

I just purchased a new PRO-2050. I asked to order a service manual. I was told they were only available to the service centers. Does that mean that the radio could be modified?

wrote:

>Anybody know if it is possible to use&log ACARS from Nuuk - Greenland ?

Why not? A lot of N.Atlantic traffic will be passing to the
south of Greenland. Much of it will be at a height which
will probably enable them to use the VHF ACARS frequencies.

>Any "real-life" testing done ?

You mean here in W.Europe, or in Greenland?

462. Old 900 MHz VTech phones (was Re: 900 MHz phones)

Newsgroup: rec.radio.scanner
Date: 1999-02-05 00:00:00 UTC
From: Adrian Brandt <abrandt@americasm01.nt.com>
Message-ID: <36BB7097.69EB892D@americasm01.nt.com>
Source record: 128585
Cross-posted to: alt.consumers,alt.radio.scanner,misc.consumers,misc.consumers.house,rec.radio.scanner

Yeah, I loved the performance of my VTech 900DX. The ergonomics of the thing weren't the greatest. Anyway, my keyboard started flaking out on me to the point where it was very difficult to dial a number without either missing digits or accidentally getting double digits while jamming the flaky keys down to make contact.

Once it got to a certain level of intolerability, I decided since the phone was long since out of warranty, I had nothing to lose by taking it apart and trying to diagnose/fix the problem. Once I got to the keypad (had to remove a circuit board and/or connector or two, as I recall), it seemed kind of goopy so I just swabbed each of the contact areas with a Q-Tip soaked in some alcohol. I reassembled the handset and, voila--the keys worked fine again.

Eventually the keys started acting up again and before I could get around to re-opening the handset and cleaning it, the handset stopped working for completely different reasons (I assume)--and that was the end of it.

I bought a new VTech 900 NDX and have had no problems with it for a couple years now. The 900 NDX is just an updated version of the old 900 DX, but they seem to have improved the keypad. I'm hoping that the keys going dead problem was fixed on the NDX...

Oh, and by the way, a number of 900 MHz digital cordless phones (such as some of the 9000 series from AT&T) were merely re-badged VTech phones. So I always thought it kind of interesting when people posted that they tried a VTech phone and then returned it and got an AT&T phone they liked much better when all they did was get a re-badged/packaged VTech phone.

That is because of an agreement between RS and the FCC. They no longer sell service manuels for new scanners to anyone. An e-mail I received from RS is posted somewhere, but that's the story. They don't want anyone doing mods.

The Icom discone is constructed exactly like the diamond and has the exact same
center thingy that all the radials come out of.
The major difference between the two is that Icom's discone has an N-Type connector
and also seems to have slightly longer whip, horizontal and ground radials.
The Radio Shack discone has a noisy crimp type design where the ground radials are cheaply
crimped around center nuts.
Also, the Radio Shack discone has a considerably shorter whip.

> I would think the ICOM discone would also be well made compared to the Diamond discone.

471. Calling All Citizens Chat Event RPL111

Newsgroup: rec.radio.scanner
Date: 1999-02-05 00:00:00 UTC
From: dpinero@pobox.com
Message-ID: <36bb687c.138714501@news.mindspring.com>
Source record: 128594
Cross-posted to:
alt.law-enforcement,alt.radio.scanner,rec.radio.scanner,alt.radio.broadcasting.open,alt.emergency.services.dispatcher

CHAT WILL FEATURE DISCUSSION ON CLOSED BROADCASTING POLICY IN HARRIS COUNTY, TX.

Many public safety officials believe that encrypted or "closed" broadcasting enhances officer safety and common-sense security. Open broadcasting pundits, of which many are hobby scannerists, believe the exact opposite and have adopted most if not all of the principles exemplified at http://members.aol.com/truth4000/page1.htm .

Until recently it was a fair democratic debate between experienced, well-intended public safety administrators focusing on security issues; and close-to-the Earth scannerists who fully understood what benefits positively exploited open broadcasting policies could mean. They had after all been taking advantage of a technically-dictated 60-year reign of open air communications.

However, the tone turned ugly in at least one confrontation between an open broadcasting preservationist and his local officials, and it may be a sign of the things to come. A scheduled chat hosted as an open broadcasting advocacy event will focus on censorship-like efforts on a radio monitoring website in Houston, Texas.

John, the webmaster of HoustonScan.com, will answer questions and generally discuss his experiences with Harris County Officials who demanded that he remove a list of trunking IDs from his website. He will also talk about the outcome of his efforts which will inspire, enrage, and shock everyone present.

The chat will be held Saturday, February 13th, at 9:00 p.m. (EST) in the java-based open broadcasting chat room found at:
http://members.aol.com/truth4000/chat2.htm

The chat will last officially one hour. Obviously, however, great discussions are never terminated and may run the gambit of the evening depending on interest and turn out.

To get some background on John's experience, visit his excellent information site at:
http://HoustonScan.com/ and http://RadioScanner.com/

This is a grass-roots philosophical movement. There is no budget, no grand standing, no attempt to judge. The chat, as are all open broadcasting chats, is driven by the wisdom and insight of those who understand the benefits of open broadcasting, and the threats of public safety systems going closed.

In the event of technical changes or updated chat information, you can check bulletins posted at http://members.aol.com/truth4000/page1.htm . For the truly interested, I encourage signing up with the Listbot-based listserv dedicated to this niche theme. A form for doing so is provided at the above site.

This notice will be retransmitted multiple times until February 13. For your filtering convenience, the key 'RPL111' has been added to the subject line so that the messages will be deleted in your future usenet sessions.

See you there!

Forget the discones and active rods. Get yourself a Monitenna from Channel Master. It is essentially a vertical dipole and has a total height of around 8 feet. It will outperform the discones across the board. I know as I used several discones and active verticals before finding out about how impressive this great buy really was. It is only 50 buck and includes 50ft of RG6 shielded cable.

Not that I have heard of. I would imagine that only iCOM has this info.
At least thus far...

More than likely it will come to trial and error as various people try
and succeed/fail. This same issue has been discussed with regard to the
PCR1000 (which is in the same boat as the R10) on its mailing list
without
much useful info produced.

Source record: 128677

Does anyone know the best place to get a un-blocked AOR 8200 scanner imported ?

I was looking at Bandercom and Javiation in the UK since the Canadian distributors appear to want an extra $100 US for the priviledge of buying from them.

Also are there any differences in the band plans or coverage that must be reprogrammed for US band plans.

487. FA on Ebay : RS Pro-51 Scanner (Cellular Capable)

They screwed me. They charged the UPS shipping to my credit card and then
shipped the radio to me freight collect! Bastards!
On phoning them, they told me that's the way it is. So, be prepared.

Okay here goes

Mobile Data Terminal (MDT) Frequencies

Last Updated 04/03/97

Edited By Howard Higgins (hh357@aol.com)

Lines changed or added since the last update are marked with a "|".

Please send corrections and additions to hh357@aol.com. Of special
interest is manufacturer and protocol information.

Although most of the current listing concerns California, the intent
is to cover the entire U.S.

My thanks to all those who have sent frequencies and information
for this list. Because many people have asked to remain anonymous,
no contributor names will be listed.

There are several MDT manufacturers. They are identified when known.

Kirk,

The Pro-2006 has been discontinued by RadioShack in the US for a couple of years now. I understand there are still some available at dealers in Canada and England.
Other than that, you'll have to look to the used market. Probably the best place to watch is right here on rec.radio.scanner.

A problem with programming from the factory. I've been told the only way
to
fix it is reload each memory channel, one at a time. A "lot" of button
pushing.
You could download the whole radio with DJX10R software and go through
the
computer, fixing each memory one at a time. Still a lot of keyboarding
though!

I don't understand how you had this capability in the "T" version.

> end up with a very handy device. I don't think I will any longer need
> my PRO43 and PRO2006!

I'm not quite as happy with mine. I get FM broadcast along with my local
PD in th 155 mhz range. THe problem is minimal on the stock antenna but
with any type of better antenna the problem gets much worse. WHen mobile
the FM broadcast is almost the same audio level as the PD, making them
hard to hear. I use a 2 meter/440 dual band amateur antenna for scanning
while mobile.

I like the flexibility of the X10 along with the computer
programmability

features but I'm not pleased with the selectivity of the receiver. My
AOR8000
was much better dealing with selectivity and high RF environments. I
hate to
resort to an inline FM broadcast filter to eliminate this problem.
ANyone got
any ideas?

tia

Thanks very much to everyone for the leads and tips on
the dummy AA battery request. I did check with our
local Radio Shack, and the crazy dummy AA batteries are
$3.99 each in their replacement parts list. I may try
the wooden or aluminum dowel method too. Much cheaper
than the pre-made RS part! Thanks again! Steve
KC6IJM.

A message to the orriginal poster. When stating the time of your show, it would be much more useful to use UTC instead of local time. To someone that didn't know the station they would have to wonder what time zone you are referring to.

A WATT meter in the antenna line does not work on the receive circuits.

You need a signal strength meter hooked up, probably to the AGC, into the receiver itself. The rcv signal is in the micro watt range. You'll need the rcvr's ability to tune and amplify the desireed sihnal to get a usable signal strength reading on a meter.

Chester Howes

Don't know where you live Steve,

[I'm going to poke a little fun at you - hope you don't mind.]

Have you tried looking up the dealers on the Diamond web page?
(http://www.rfparts.com/diamond/)

HRO and Amateur Electronic Supply I suppose have the most locations. I visited Universal in Columbus and they seemed like nice folks. Most all of these dealers do mail order. Many of them have web sites.

Alf

I have a few of the frequencies for Target programmed in my scanner. I was recently at Target, but I did not hear anything. I have seen personnel using their radios numerous times when I have been in the store.

"There are only two ways to live your life: One is as though nothing is a miracle. The other is as if everything is." - Albert Einstein

Anonymous wrote in message <199902062306.AAA06053@replay.com>...
>Hello. I am posting this anonymously for fear of my life. Many of you think that picking on John Mackey and the others is just harmless fun. I did too until very recently.
>
>I was on my way home from work last Thursday night when I noticed I was being followed. Curious to see who it was I puled into a nearby gas station and purchased a soda and some snacks, you know, just useless junk, but I wanted to see who else came into the store. Sure enough, two dudes in black suits walked in and looked right at me. They were all dressed up like the secret service or something - I don't know. These guys were serious about following me. I did notice something odd about them though. They were wearing sunglasses, but it was 7:30 at night. Anyway, that doesn't matter now. I'd better type fast, they might have this line tapped.
>
>I continued pretending not to notice them although I couldn't stop snickering about the sunglasses thing. I kept wondering if they thought it was halloween. I go and pay for my snacks and head for the door, and as I walked back to my car my frequency counter started to
>beep. I looked at the display and saw the frequency: 443.575 Mhz. That looks familiar, I thought, but then I looked at my car and realized I had left the window down. I had been bugged!
>
>Just then I turned to look back at the FBI looking guys and they were walking towards me! I heard one of them whisper to the other "I think he's onto us" and the other just nodded, reaching into his jacket.
>
>Needless to say I didn't stick around long enough to see what they were going to do next. I took off running, and they gave chase. They were yelling "federal agents! stop!" but I didn't know if they were real feds or not. My mind raced as I ran to think what they might want with me. Could it be my cellular scanners? Unpaid parking fines? Overdue library books?
>
>I finally lost them a few blocks from the store, but I was still several miles from home. I couldn't go there anyway, they'd surely be waiting for me. Unless these guys were just muggers trying to trick me. So, I decided to call home. Sure enough, my wife answers. I say hello and she says "hello sweetie. When are you coming home? I made your favorite, meatloaf" which is

our codeword that means the feds are there. I said "Not for a while yet, going bowling with the guys tonight. I'll call later" which means get the f--k out of there and meet me at "our prearranged location". For obvious reasons, I'm not posting the actual location here hoping that my wife can escape from custody and meet me there.
>
>Then it hit me where I saw that frequency before. Take a look at http://www.parg.org/News/ Frantically I searched the ham bands on my scanner. This is what I heard:
>
>"N7QOR to KA0SSF. John, you there?"
>
>"KA0SSF to N7QOR. Yeah Nick. I'm here."
>
>"So, do you think we made our point?"
>
>"Yeah, we've got him running scared now. It's only a matter of time."
>
>"Too bad he spotted those feds after they planted the bug. That'd could have made for some interesting listening."
>
>"So what should we do to the others?"
>
>"Same thing we're doing to [my name was mentioned here]"
>
>"HA HA HA HA HA. Yeah, I like the sound of that. That'll teach them to mess with [A local amateur radio club's name was mentioned here]"
>
>I found an abandoned car to sleep in and then met my wife at our meeting place with tickets out of the country. But let me tell you, these guys are good and they don't f--k around, OK?
>
>We took seperate cabs to the airport, and the place was crawling with cops. I couldn't figure out what the hell was going on, but my wife and I were pounced on as we exited our cabs. We were taken to an interrogation room and there on the table was printouts from the newsgroup. Some were actually mine, but someone else logged in as me and posted a whole bunch of cancels on the sex newsgroups and then flamed the hell out of some addicts on the sex addicts groups. Then they put up a kiddie porn site and listed me as the contact point. I tried to explain that I was framed but then they pulled out box after box of disgusting porn tapes and asked me to explain how those tapes got into my house. I said I never saw them
>before, they couldn't have come from my house, but they insisted that they did, and I was looking at serious jail time. I did nothing wrong, yet these f--king cops had already raided my home, frozen my assets and towed away my car. Then they included using my scanner to aid in the commission of a felony to the long long list of charges.
>
>I was in some seriously deep shit. Framed by Mackey and his pals. Those assholes... I was ready for blood. I yelled "Look out" and the cops turned

to look and I split. Good thing I keep a handcuff key in my sock! They never knew what hit them and despite the surveillance cameras and cops everywhere I made my escape.
>
>I am now living on the run, and I have no idea what became of my poor innocent wife - all because I wanted to have some "harmless fun" on the internet. Rest assured though, when this is all through I will have my revenge on those bastards. They haven't seen the last of me!
>
>To everyone out there who likes to flame Mackey: Smalley, allsafe, Cheek and the others, stop now, before it's too f--king late. Don't end up like me, please. Take this as a stern warning from an anonymous friend and ally, YOU DON'T WANT TO F--K WITH JOHN MACKEY!!!!

Yeah. I know what that says about the frequency coverage, but I still stand by what I have said. That it will outperform any discone or rod antenna out there from 27-1000mhz period. I tried too many to name and it blew them all away.

Chinese pagers use 2 ASCII characters to display 1 chinese character.
They usually are sent and "escape code" (like "Shift In" (ASCII 15) and
"Shift Out" (ASCII 14)) to shift back and forth between chinese mode and
english mode. The paging company encodes each chinese character in 2
ASCII characters that can be handled by the ASCII RF encoder and the
pager unencodes the data into chinese characters.

BTW, cool signature! I wish mine looked like that! It would sure fool
the spambots! :)

Had a friend in a similar situation that didn't know what to do. He was told to call the phone company, which he did. They(US West) ran a specific line test from the switch that located a bug in the companies PBX. All within a matter of mintues. The phone company could tell which lines were clear and which ones were tapped.

519. DJ-X10T Questions

Newsgroup: rec.radio.scanner
Date: 1999-02-06 00:00:00 UTC
From: Gary Sargent <ke8wo@worldnet.att.net>
Message-ID: <36BC505C.214717C4@worldnet.att.net>
Source record: 128490

I picked up a DJ-X10T (sn. T000850)last week and I am very pleased.

I have noticed two somewhat minor issues:

1. The DJ-X10 comes with many of the 1200 memories preloaded with useful frequencies. However, most of these memories will not receive or scan properly. It seems as if the receiver is muted. I noticed the portion of the display where the receiving mode (AM, NFM, USB, etc.) is normally displayed shows only the squelch setting (e.g.. SQ0_). Further, when I try to set the mode, I really seem to enter the setup menu. Is this a software problem? Does anyone know how to clear this, but preserve the memory's contents? I know I can simply re-store the memory's frequency to the memory location and the problem is gone .. but with 1000+ memories that's a lotta button pushing!

2. In trying to clear up the above, I did a "System" reset. In addition to not clearing up the above problem, I lost the ability to scan the cell phone band. (My unit was able to scan the 869 mhz cell phone band out of the box.) Does anyone know how to restore this feature? Even if this can not be restored, the DJ-X10 receives cell phone images in the 1420 mhz range very well .. so the loss of programming the 869 band frequencies is really not a problem.

I would highly recommend the DJ-X10T. It is a good shortwave receiver, though not quite on the same level of my Sony 7600G & 2010, and a good scanner, though not quite on the same level as my PRO43 & PRO2006. However, when you combine a good shortwave and scanner receiver in the same small package and add lots of memories and assorted features you end up with a very handy device. I don't think I will any longer need my PRO43 and PRO2006!

What to listen for
Here is some information that might be useful while listening to
Bethlehem's trunked radio system.

EMS units are dispatched on either an alpha, bravo, charlie, or delta
response to a call. A delta response is the most rapid response, an
alpha
response is the most cautious.

Moravian College campus security, Lehigh University campus security,
and Bethlehem Area School District security all use Bethlehem's trunked
radio system.

Here is a list of unit numbers you will hear, and what department uses
them:
100's and 200's - Police Department (Unit 200 is the Comm. Center)
100's, 200's, 300's - Fire Department
400's - Parking Authority

500's - Moravian College Campus Security
700's - Paramedics
800's - Lehigh University Campus Security
900's - Bethlehem Area School District Security

Bethlehem's Radio Codes
Here is a list of radio codes used in Bethlehem.
Last Updated: 7/19/98

10-1 - End of shift/Out of service
10-2 - Clear
10-3 - On scene / Busy
10-4 - Message received / "Yes"
10-6 - Responding (fire dept.)
10-7 - On scene (fire dept.)
10-8 - Fire Out (fire dept.)
10-9 - En route to base
10-10 - Repeat last transmission
10-11 - Registration check
10-12 - Call _____ by phone
10-13 - Fire Scene Secured
10-18 - False Alarm
10-20 - Give current location
10-33 - Correct Time
10-39 - Cancel Message
10-42 - Prepare to copy information
10-44 - Going to Gas Pump
10-45a - Airport Alert
10-45b - Airport Bomb alert
10-55 - Clear the air
10-99 - Officer Needs Assistance

Bill Cheek's 4-Level FSK Data Decoder Interface
Frequently Asked Questions File
================================================

Contents
=========
```

01: What do I have to do to get into 4-Level FSK decoding?
02: How do I go about getting into 4LFSK on my own?
03: What help is available for getting into 4LFSK decoding?

Questions and Answers

==========
01: What do I have to do to get into 4-Level FSK decoding?

The very first step is to install and test the NFM Discriminator tap or "Baseband Audio" Mod in your scanner using a 2-Level FSK Data Decoder Interface. This is a two-part process, fairly elementary, that is fully described in another of my FAQs called SCANDATA.FAQ, freely available at:

http://ourworld.compuserve.com/homepages/bcheek/scandata.txt

So to answer your question specifically:

A. Install a "baseband audio tap" in your scanner, and
B. Build the simple 2-Level FSK Data Decoder Interface
C. Test it with a freeware program called TRUNKER, now in version 3.7 or so.

After you've completed those first three steps, then:

D. Decide whether you want to have a go at the 4LFSKDDI completely on your own, or if you need varying degrees of outside assistance.

==========
02: How do I go about getting into 4LFSK on my own?

Cool! That's the spirit! Except this FAQ ain't the place. There's not a lot to decoding 4LFSK signals, but you do have to have the right hardware and software.

The software is a "no-brainer" for the most part, but you do have to build the 4LFSK Data Decoder Interface. This puppy is just a little too "hairy" to put into a simple ASCII drawing like I did for the 2LFSKDDI in my SCANDATA.FAQ file.

So, you have to launch the adventure on your own, but I can help you get started. Fire up your Web browser and check out the following sites:

http://www.geocities.com/SiliconValley/Horizon/6063/

http://www.qsl.net/pa3eik/4lev_fsk.htm

http://www.geocities.com/CapeCanaveral/Launchpad/4039/

http://www.geocities.com/ResearchTriangle/Lab/9339/

http://www.geocities.com/SiliconValley/Network/8916/4levelm.gif

Each of the above sites supports 4LFSK to some extent, be it hardware, software, or both. If you are going to go it alone, on your own, then exit here and start researching those support sites.

==========
03: What help is available for getting into 4LFSK decoding?

First, no matter what, you should investigate the Web sites given in Q&A #2 above. The information at those sites is helpful to some extent. If you are technically inclined, those sites may be all you need or want in terms of help.

If you are not technically inclined, or if those Web sites are so much "Greek" to you, leaving you with a feeling of helplessness. Relax.....

If you aren't comfortable taking on a 4-8 hour technical project on your own, or if you're a working stiff with spare time about as plentiful as gold, then maybe I can help to some extent.

In fact, I can help in several ways, each designed for a specialized budget of time and resources.

A. I developed a detailed high-resolution laser printed Instruction Set that has 8-pages of text, tables, charts, drawings, references, parts lists and photos to guide the casual (or busy) hobbyist to success at decoding 4LFSK signals.

If all you need is an A-to-Z guide that dispenses with technical jargon and just efficiently guides you from nowhere to success, then this Instruction Set might be all you need. The price is right.

4LFSKDDI Instruction Set; you provide all materials and parts, and build the hardware and set up the freely downloadable software per my guidance.

Price: $5, ppd USA. $7, ppd, foreign
==========

B. I can also provide a Kit of essential parts along with the Instruction Set in (3-A) above. The Kit Parts List is given below along with other lists of probably needed or wanted materials that are not provided in the basic Kit.

4LFSKDDI Instruction Set plus Kit of essential parts; you provide other optional materials and parts; build the hardware and set up the freely downloadable software per my guidance.

Price: $20 + $8 S&H USA. $20 + $15 S&H, foreign

Parts List (Stuff Provided in Kit)

Qty Description
=== ======================
1 Instruction Set (See 03-A above)
1 LM324 Quad Op-amp
1 LM339 Quad Comparator
3 capacitor; 2.2-uf/25v; tantalum
1 capacitor; 0.01-uF/50v; monolithic
2 capacitor; 0.1uF/50v; monolithic
2 diode; 1N914/1N4148
1 resistor; 1-M
1 resistor; 2.2k
2 resistor; 15k
2 resistor; 100
2 resistor; 22k
2 resistor; 47k
3 resistor; 2.7k
1 RCA Jack
1 DB9 Jack (female)
1 Perfboard; 18 holes x 15 holes
2 Trimmer pot; 10k; mini
or, at our option, two 4.7k fixed resistors

Parts List (Probably needed or wanted; not supplied)

Qty Description
=== ======================
1 Enclosure (Project box)
3ft Shielded audio cable (RCA plug on one end
with plug on other end to match the
baseband audio jack on the scanner.)
6ft Shielded serial cable (DB9 female on one end
to mate to 4LFSKDDI output and a DB9 male
or DB25 male on the other end to mate to
the selected COMport on the PC.
2 IC socket; 14 pin DIP
? Small quan of 22-ga uninsulated solid copper wire
? Small quan of 22-ga stranded, insulated,
color-coded hookup wires.
? Small supply of "break apart" pinline sockets:
Digi-Key: p/n A208-ND (800) 344-4539
Hosfelt: p/n 21-274 (800) 524-6464
Mouser: p/n 151-5520/5530 (800) 346-6873
? LEDs, switches, etc.
1 Dual polarity power supply, +/-12.6 volts max
Can be as low as +/-5v, but 9 to 12v ideal.
Can be as simple as two 9v batteries or two
9v wall-warts wired as follows:

```
o----------> +9v on 4LFSKDDI Board
+ |
-----
--- 9v battery or
----- DC adapter
---
-----
---
_ |
o----------> Ground on 4LFSKDDI Board
+ |
-----
--- 9v battery or
----- DC adapter
---
-----
---
_ |
o----------> -9v on 4LFSKDDI Board
```

OTHER NECESSITIES (Not provided)

Qty	Description
1	PC (Pentium 133+) (486 computers, maybe)
1	Scanner with 800-960 MHz (cellular not required); (must have NFM baseband audio mod)
?	Soldering equipment and basic electronic tools

==========

C. I am working on ways to provide Assembled and Tested 4LFSKDDI boards, including enclosures, power supplies and basically everything in a package.

For now, all I can supply are prototype Assembled and Tested 4LFSKDDI boards with RCA and DB9 jacks attached....essentially ready for you to install in an enclosure of choice and connect the +/- power supply of choice.

Price: $100 + $8 S&H USA. $100 + $? S&H, foreign

NOTE: This price includes only the Assembled/Tested 4LFSKDDI board and jacks, as described above, as well as the Instruction Set. Power supply and enclosure not included.

==========

D. Assembled/Tested 4LFSKDDI built into a suitable enclosure, with Instruction Set. You provide the external +/- power supply.

Price: TBA (Not available yet) (or inquire for custom
pricing)

E. Assembled/Tested 4LFSKDDI built into a suitable
enclosure, with Instruction Set and power supply

Price: TBA (Not available yet) (or inquire for custom
pricing)

OTHER INFORMATION
=================

TO ORDER: Use e-mail, fax, or postal mail per the
information in my signature box below.
MC/VISA or M.O. preferred. ($10 minimum
credit card order) Personal and company
checks okay, but shipment delayed until bank
clearance. No COD's and no shipments to PO
Boxes or mail drops. Alaska, Hawaii and
foreign shipping extra.

TERMS: All sales are final; no returns-no refunds.
No warranty on Kits.

==
That's it for now. I will keep this FAQ updated. If you
see things that need to be added to it, by all means, let me
know. If this FAQ fails to address your question(s), then
hit me with 'em, but be specific. And be detailed with
symptoms and observations if you need tech support on mods
or troubleshooting and diagnosis. Use e-mail: bcheek@cts.com

01: How do I restore cellular in my scanner ?
02: What about cellular restoration ads scanners after 3/94?
```

03: Are any mods available for my scanner
04: What mods do you have for my scanners?
05: Can you send me "the mod" for my scanner?
06: Where can I find mods for my scanner ?
07: So you mean there are no mods for my scanner ?
08: So how can I do some of these mods?
09: Memory mods? How can I increase the channels?
10: How do I tell a SRAM chip from an EEPROM from CPU RAM?
11: My scanner has an SRAM; how do I do the mod?
12: Do you do scanner modifications like memory mods?
13: I'm not interested in all your mods - just one. Will
you photocopy the information for me?
14: So how do I restore cellular in the PRO-2006?
15: How can I install the military aero band in my scanner?
16: How can I modify my scanner to follow trunked systems?
17: Can my scanner be interfaced to a computer for remote
and automated control, as well as for programming of
the memory channels by the computer? Can the
interface acquire data from the scanner and send it to
the computer?
18: What's a 'discriminator output' and a 'data slicer'
19: How can I build a 'data slicer'?
20: What if I don't want to build a 'data slicer'?
21: What books have you written, generally what topics do
they cover, are they still in print, what do they cost,
and are they available to order at a web site?

==========
QUESTIONS AND ANSWERS
==========

01: How do I restore cellular in my scanner ?

Forget it, pal. It ain't going to happen. The TDDRA of 1994
(an Act of Congress) expressly forbids the manufacture or
importing into the USA of "easily modified for cellular" scanners
after April, 1994. Manufacturers were required to remove cellular
capability from the scanners' CPUs altogether. Sorry, cellular
coverage is not possible if your scanner was made or imported after
March, 1994.

But here is a list of all those pre-1994 scanners of which I am
aware that ARE capable of cellular restoration:

PRO-2004 BC-855XLT *3 Regency 4030
PRO-2005 BC-200XLT Regency 1600
PRO-2006 BC-205XLT
PRO-2022 BC-760XLT *4
PRO-2026 *2 BC-700XLTA *4
PRO-2027 BC-890XLT *4
PRO-2030 BC-950XLT
PRO-2032 BC-2500XLT *3

PRO-34
PRO-37
PRO-39
PRO-43 *1
PRO-46 *2 *5
PRO-51 *2
PRO-23 *2

Note 1: Date of Mfg code 1A4, 2A4, xA3, xA2 (label in battery compment), or no "A" in the serial no.

Note 2: Date of mfg code 1A4, 2A4, -A3, -A2 (label on back).

Note 3: Date of mfg code must not end in the letter "D", except for OAID.

Note 4: Date of mfg code must not end in the letter "D".

Note 5: Units with date code of 5A4 can tune cellular in 30 kHz Steps using a keyboard entry sequence.

For instance, PRO-43's imported before March, 1994, are modifiable, while some brought in during March and all thereafter are impossible to modify. Date codes of any -A2 or -A3 and only 1A4 and 2A4 are assured of being modifiable. 3A4 and up probably aren't.

The above list does not include those scanners that were naturally capable of receiving the full 800 MHz band, without modification. The below list of radios had relatively continuous coverage that includes cellular:

J.I.L. SX-400 Yaesu FRG-9600 AOR-8000 *
Regency MX-4000 AOR-950 Icom R-7100 *
Regency MX-5000 AOR-1000 Icom R-1
Regency MX-7000 AOR-1500 Icom R-100
Yaesu FRG-9600 AOR-2500 Icom R-9000
Kenwood RZ-1 AOR-3000 * Icom R-7000
Uniden BC-800XLT

* pre-1994 only

Some of these radios, if still current, had the cellular removed by the factory after March, 1994. There may be possibilities of restoring cellular in later models of the AR-8000, AR-3000, and ICOM radios by replacing an EEPROM or reprogramming one, but that is beyond the scope of this FAQ, and in general, should not be considered feasible.

==========
02: What about cellular restoration ads for post 3/94 scanners?

Yes, I used to see magazine ads to "restore" cellular or to "unlock 800 MHz" in newer scanners. Gasp! This is almost a deception. See, these ads were for the "VD" mod.

Virtual Downconversion - better than a venereal disease, but not by much. To my way of thinking, it is an inferior method of "unlocking" the cellular bands because:

A. They're not really unlocked. VD is a trick of turning off one oscillator and turning on another. Typically, they set the scanner to the 400 MHz band, and then turn off the normal 400 MHz Local Oscillator and turn on the one for 800 MHz to make cellular receivable on the 400 MHz display.

B. There is no logical correlation between the actual cellular frequency and the displayed frequency. It varies from one radio to the next, but suppose 880.000 MHz comes in. It might be received/ displayed on 432.6775 MHz. Duh....??

C. The full cellular bands of 823.950-849.000 and 868.950-894.000 are not available by this method. In fact, only a small part of one or the other (often not both) is available, like maybe 10-20 MHz of the total.

D. There is no 30 kHz stepping. You're limited to the default CPU "rules" for the band in which the cellular appears, typically 5 kHz or 12.5 kHz.

E. The exact results of the VD mod, generally described above, depend on the scanner. Results vary from one to the next. None are what I'd call "good" or even acceptable.

The good thing that can be said for the VD mod is that it is the ONLY way to get any cellular at all from post March-1994 scanners. So, the advertisements that you may have seen are not exactly "fraud".....but you sure don't get much.

==========
03: Are any mods available for my scanner ?

You may have the wrong impression about scanner modifications and hacking. Mods are not "available" in the sense that they can be found on a store shelf, or laying on the top of someone's mind who can tell you in so many words or less how to turn that a Snakebite X101 scanner into a fire-breathing, rip-snorting behemoth of a TurboWhopper.

All scanners can be modified for something; generally a dozen or more things. But only a few scanners have anything written about them in detail. And you have to know where to LOOK. You can't just up and ask for "mods".

Well, you *can*, but you won't get a substantive reply.

It takes me several days to several weeks and sometimes
MONTHS to work up and write about a hotshot mod for a
decent scanner, and after THAT level of effort, it's not
possible to make it "available" off my fingertips. Continue
reading below. There are answers to your question.

==========
04: What mods do you have for my scanners?

I wish I knew what people mean by: "what mods do you have..."
I don't "have" mods, exactly.....

I wrote three books and eight years worth of the monthly WORLD
SCANNER REPORT that feature mods for a variety of scanners.
With over 900 scanners ever marketed, I don't pretend to cover
them all.....just, a fraction.

Many of "my mods" can work with most any scanner.... but there is
no way I can write explicit instructions for more than the bench
models on which I develop mods. I can and do offer hints on
how to apply these mods to other scanners but again, not having
the scanner in front of me and not having the Service Manual,
there is little I can do other than hint.

I have to leave it to the user to study the published materials
and then ask specific questions to which I am happy to provide
specific answers...if I can. That's about as good as it gets.

You are strongly encouraged to thumb through my books and through
the back and current issues of the WORLD SCANNER REPORT to see
what interests you and to pick topical material from which you
can phrase specific questions that have possibilities of reply.

As it is, all I can say at this point is that DOZENS of mods are
possible for your scanners, but I have to leave it to you to do
the legwork and research. And when you have specific questions,
then I can answer them.

==========
05: Can you send me "the mod" for my scanner?

Well, what is "the" mod? There are dozens of possible mods
for your scanner. Regardless, the answer in general is no, I
don't "send" mods. I have published hundreds of mods for various
scanners and other radios in my books; in the monthly World
Scanner Report, and some as text files on my Web and FTP sites.
You can exhaust these resources to your heart's content.

Due to the overwhelming flood of requests for this kind of
information, I can't do personal and custom research. There just
isn't time in the day for that workload. If it's free info you
want, try looking up scanner Web and FTP sites. If you don't mind
paying for better quality info, then try books and magazines.

You can also try the Usenet REC.RADIO.SCANNER newsgroup where
modification information is sometimes published. It's free if
you have a connection to the Internet and a Usenet reader/editor
program.

==========
06: Where can I find mods for my Brand-X scanner ?

Mostly you can't. There are only a handful of scanners ever
made that were worth focused research and development.
Those scanners include:

PRO-2004 PRO-2005 PRO-2006 PRO-2035 PRO-2042
PRO-2022 PRO-43 PRO-34 PRO-37 BC-200XLT
PRO-26 PRO-39 BC-3000 PRO-64 PRO-2041

You can find occasional articles and files on "mods" for other
scanners not mentioned above, but they are the exception to
the rule. Start by looking up scanner Web and FTP sites, and
peruse their quick-links to other sites:

Many scanner Web Sites have quicklinks to dozens of other sites
that may contain a file or two on generic "Snakebite" scanners.
But don't get your hopes up.

Now here is the problem: I am one of the few, (if not the ONLY)
engineers seriously committed to scanner mods.

Yet, there are around 1000 scanners on the historical list now.
It is physically impossible for people like me develop hacks
for any but a few. We have to choose among the more popular
scanners, you see....certainly the ones that interest us. Now
what scanners do you suppose engineers and technicians will
find "interesting"? Not many, pal.... not many.

The above list of scanners reaches out to tens or hundreds
of thousands of owners. There is no time left to work on
generic "SnakeBite" scanners that have little to offer, even
after hours of hard work! But take cheer and read on.......

==========
07: So you mean there are no mods for my scanner ?

More or less I mean that, but, that's not to say yours can't
be modified. It can! It's just that there is nothing published
for it; nothing in the way of step-by step instructions with
graphics, photos, and details.

No one would go to the time and trouble, you see? The
preponderance of published hacking information is for those
scanners listed in Question 05 above. Other scanners just aren't
interesting enough for professional investigation.

An engineer who is capable of designing super-hacks for that
"SnakeBite" scanner isn't going to own one! Instead, he will own

one in the Question 05 list, one that is eminently capable of
some very powerful modifications in the first place.

Now I said your "SnakeBite" can be hacked. It can.

But you are more or less on your own in the sense that you can't
be directed to a "shopping list" of mods from which you can pick
and choose. There is no such list. Any hope for you is to first
figure out what you want to do, and ask specific questions.

I can give you a few answers in advance:

No.

No, your scanner is likely not capable of cellular; scanners made
or imported after March, 1994, are not cellular-capable. Most scanners
are not likely to be capable of extra memory; additional frequency
coverage; and things of that nature that pretty much require factory
design in the first place. (See ahead for Memory Modifications)

Yes.

Yes, your "SnakeBite" may be capable of certain mods, a few
of which include the following: (You wanted a list?)

1. Tape Recorder Jack
2. Automatic Tape Recorder Switch (beats VOX!)
3. Extended Delay
4. Tone Decoder-Rejector Countermeasure
5. CTCSS mod
6. S-Meter
7. Scanner-to-Shortwave Interface
8. Carrier-On-Indicator
9. Audio Improvements
10. Beep volume or disable
11. Squelch Improvements
12. Remote Controller
13. Discriminator output for data decoding
See Question 18 - this can be done to all scanners
14. Event or "hit" Counter
15. Shielding of plastic cases
16. External DC power
17. Improved Adjacent Channel Rejection
18. Speed up of SCAN & SEARCH modes
19. Back light modifications

Then, maybe...depending....on the scanner.... the following
digital and/or esoteric enhancements.....???

20. Interfacing to a computer
21. Subsidiary Carrier (SCA)
22. Extended Memory to 25,600-channels & up
23. 54-88 MHz restoration

24. Data/Tone/Noise Rejection
25. Trunk "Tracking" - maybe.
26. Cellular restoration (See Question 01)

==========
08: So how can I do some of these mods?

That's a problem. No one has written them up for any but a few scanners. About the only way I can think of is to get one or more of my three books and a subscription to the WORLD SCANNER REPORT. Research and study up on the mods we've developed for other scanners, and then compare the procedures for that specific scanner to yours. Often, when I write up a mod, I give hints on how to apply it to other scanners.

Also, if you ask me *specific* questions, I can give specific answers. If you ask "how to do a memory mod", I'll have to refer you to something already in print or published somewhere. If you are doing a memory mod and run into trouble, then I can help you with that trouble.

==========
09: Memory mods? How can I increase the programmable channels?

That depends on what kind of memory storage is used by your scanner. There are three kinds:

1. On-board CPU RAM (Random Access Memory)
2. Static Random Access Memory (SRAM)
3. EEPROM Electrically Erasable Programmable Read Only Memory.

The first kind is most prevalent and there is no way to expand that kind of memory. It is, however, usually limited to scanners with 50 channels or less of programmable memory. 100-channels and up are usually done by methods 2 or 3. So your first step is to determine what kind of memory is used by your scanner.

EEPROM memory is expandable, but very difficult under most circumstances. SRAM is the easiest and offers the largest expansion capabilities. For example, the PRO-2004, PRO-2005, and PRO-2006 can be expanded to 25,600 programmable channels (and more)! The PRO-32, PRO-34, PRO-37, PRO-39 & PRO-2022 can go to 12,800- channels and beyond. The BC-760XLT, BC-560XLT, and a few others can be taken to 6,400 channels and more. The PRO-2035 and PRO-2042 can be taken to 16,000 channels and beyond. The PRO-2041 and PRO-64 are good for upwards of 25,600 channels.....

My Extended Memory Modifications are amply documented in excruciating detail in my books and in the WORLD SCANNER REPORT, complete with diagrams, photos, and many pages of instructions such that most casual hobbyists who know a soldering iron from a tire iron can do the work. This kind of mod is not suited to being given out in an e-mail or a forum message in so many words

or less. You will need to acquire the instructions before doing the work.

==========
10: How do I tell a SRAM chip from an EEPROM from CPU RAM?

If you can't do this on your own or after the below explanation, you are probably not a candidate for such a wild adventure at this stage of your hacking career.

Most CPUs hold a small amount of RAM (random-access- memory), sufficient to store anywhere from 10 to 50, maybe a hundred channels or so. This is the case for most scanners, so there is no way to increase that memory. Fortunately, there are two other methods of RAM used by a few scanners that offer possibilities for expansion.

EEPROM: The least common and least expansive is EEPROM (electrically erasable programmable read-only-memory). The PRO-43, PRO-26, BC-2500XLT, BC-200XLT, BC-100XLT and BC-3000XLT, for example, use EEPROM programmable memory. It is possible to expand EEPROM-types of memory, though not by such huge proportions as the SRAM type. EEPROMs are usually tiny little chips with 8-pins.

SRAM: A handful of scanners use a separate SRAM (static random-access-memory) chip for storage of frequencies and custom channel settings. It is this type of memory that can be easily and economically expanded by factors of 2, 4, 8, 16 and even 64 times the original volume! Scanners known to employ SRAM memory include the following:

PRO-2004 PRO-2021 PRO-32 BC-760XLT
PRO-2005 PRO-2022 PRO-34 BC-950XLT
PRO-2006 PRO-2032 PRO-37 BC-590XLT
PRO-2035 PRO-2041 PRO-39 BC-600XLT
PRO-2042 PRO-64

There may well be other scanners that use SRAM memory, but either I forgot about them or don't know. If you're curious about your scanner's potential for memory expansion, you can just about forget it for those with fewer than 100-channels. The CPU's RAM easily handles 10 to 100 channels or so. If your scanner is not on the above list, but has 50 or more channels, then look over its schematic diagram and parts list or scrutinize its Logic/CPU Board for any of the following types of SRAM chips:

uPD446G-15 TC-5517CF-20 LC-3517BM-15
CXK5864BP MB-8416-20LPF BR6265BF HY6264

or something similar, disregarding the last few digits and letters. An SRAM chip is generally characterized by a rectangular shape with 24 to 32 pins, each of the longest sides holding half

the pins. An SRAM chip in a schematic diagram will be characterized by eighteen or more of its pins going straight to the CPU chip. Any chip with less than 24-pins is not likely to be an SRAM; neither is any chip in a square format. SRAMs are rectangular (DIP or SMT) with 24 to 32 pins. Pinout notations of SRAM chips will include mystic codes such as:

A0, A1...A9, R/W, CE, I01, I02...I08, OE, etc.

==========
11: My scanner has an SRAM; how do I do the mod?

Get the published instructions for Extended Memory Mods. These instructions are much too detailed to include as basic text files, and in most cases, the articles are copyrighted anyway. Start by reviewing my free Table of Contents and Index to the World Scanner Report where you will find articles on memory mods. Get at least one of my books to supplement the WORLD SCANNER REPORT. The ULTIMATE SCANNER book is a good choice.

The Table of Contents and Index to the World Scanner Report can be found on my Web and FTP sites. They're also contained in my product information file: PRODINFO.ZIP

I can send these files by e-mail upon request, or they can be downloaded from my Web and FTP sites.

Since all SRAM chips are much alike, my instructions for one scanner generally apply to all, and are not too difficult to follow, provided you can find the SRAM chip in the first place.

==========
12: Do you do scanner modifications like memory mods?

Sure. Contact me privately and we can go from there. One note, though: I don't do cellular mods anymore. The FCC has gotten persnickety about that sort of thing. In general, I don't do speedup mods anymore because they cause more problems than the speed increase is worth.

==========
13: I'm not interested in all your mods - just one. Will you photocopy the information for me?

Not if it's in a copyrighted publication. My publishers own the copyrights to my books and my company owns the copyrights to material published in the World Scanner Report. It would be unethical, illegal, or both, for me to make copies.

If your budget is tight, you can in many cases get basic information for free from Web and FTP sites. The real good stuff generally comes only in books, magazines, newsletters, and such, like Popular Communications, Monitoring Times and the World Scanner Report. It is not always necessary to buy information

in order to do mods. On the other hand, the published mods are NOT the low degree sort of thing you find on BBS's and Internet sites with a few sentences or paragraphs and maybe an ASCII drawing if you're lucky.

My mods are detailed and well documented with graphics, including schematic diagrams, photos, and illustrations. This kind of work can't come for free, though.

On the other hand, there may be no cost if all you want are the simple mods like the cellular mod to the PRO-2006.

==========
14: So how do I restore cellular in the PRO-2006?

1. Remove the top cover of the scanner.

2. Look down inside the front panel behind the #3 key of the keyboard, and clip the exposed leads of the two coppery colored diodes standing on end. One restores cellular and the other gives a FREE 25% speedup of the SCAN function.

3. Replace top cover.

See, that's the kind of stuff that comes for free.

==========
15: How can I install the military aero band in my scanner?

You can't, and that's that. If your scanner didn't come with the military aero band (220-400 MHz), then there is no way under the sun of "restoring" it. You can't restore what ain't there.

==========
16: How can I modify my scanner to follow trunked systems?

That depends on your scanner. So far, the only scanners that can be "modified" to follow trunked conversations are the PRO-2004, PRO-2005, and PRO-2006. And then, it's a bit more than just a "mod". It's also a process, a method, and a bit more. If you're interested, see:

http://ourworld.compuserve.com/homepages/bcheek/trunk.htm

Otherwise, you can't, not exactly. Each trunked system is as different as night and day with respect to other trunked systems, even from the same vendor.

It is possible for the hobbyist to gain some skill and fortitude in following trunked system conversations. These techniques are scattered around in various written works, from books, magazine articles, and prefaces in frequency directories...to text files on various BBS's and Internet archives. These techniques, hints, tips, and kinks cannot be recited here in so many words or less. One good starting point might be the preface material in any

recent edition of Radio Shack's POLICE CALL books. But in a word, you cannot alter "a scanner" to follow trunked signals.

Uniden's and Radio Shack's TrunkTracker series of scanners are specifically designed to follow Motorola trunking systems.

There is some interesting software appearing around the Internet these days....that may be useful in trunk following. Check out these web sites for interesting possibilities if you don't want to cough up for a Uniden or Radio Shack TrunkTracker:

http://web2.airmail.net/lblant1/dfw/digital.htm
http://www.geocities.com/CapeCanaveral/Lab/1060/beta.htm

See Question 18 for more info on this possibility.

==========
17: Can my scanner be interfaced to a computer for remote and automated control, as well as for programming of the memory channels by the computer? Can the interface acquire data from the scanner and send it to the computer?

In a word, yes. Many scanners "can" be interfaced to a computer for one-way control and automated programming of the memory channels. These scanners include:

PRO-2004 PRO-2005 PRO-2006 PRO-2035 PRO-2042 PRO-2041
PRO-2022 PRO-34 PRO-37 PRO-39 PRO-43 PRO-26
PRO-64

Probably quite a few others are possible - most, really.

There are three scanners that are capable not only of the one-way mode of remote control and automated programming, but also of a "data acquisition" mode where the scanner sends its display (channel, freq, bank, mode, delay, lockout) and other data to the computer for automated logging and data processing. These scanners are the PRO-2004, PRO-2005, and PRO-2006.

Several companies make scanner/computer interfaces, including Optoelectronics and COMMtronics Engineering.

Each interface has its own unique characteristics, advantages, and limitations, but all are "good" in the sense of freeing the operator from much of the labor and drudgery of scanning. The Optoelectronics interfaces are generally limited to the PRO-2005/6 & PRO-2035/2042.

A "roll your own" computer interface was published in the World Scanner Report, V2N1-V2N6. Another more powerful one was published in my 3rd book, THE ULTIMATE SCANNER (Cheek3).

COMMtronics Engineering's CE-232 Scanner/Computer Interface is in its fifth year and continues to be a front-runner and state of

the art. For more info:

http://ourworld.compuserve.com/homepages/bcheek/

ftp://ftp.cts.com/pub/bcheek/ce-232

John Montalbano KA2PYJ, seems to have designed a nice
one-way interface and control software. I can't vouch
for it, but go to the following URL and see for yourself.

http://www.qsl.net/ka2pyj/

==========
18: What's a 'discriminator output' and a 'data slicer'

Ahhh, I'm glad you asked. This one is hotter'n a $2 pistol
these days. For gory details, including detailed instructions
on how to take advantage of this hot, new interest, see my file
or regularly posted newsgroup article with the SUBJECT:

"Scanner Data Decoder FAQ" SCANDATA.FAQ

DISCRIMINATOR OUTPUT
==========

But to answer your question in so many words or less,
every scanner has a Discriminator, a circuit usually
little more than a chip, the purpose of which is to
detect narrow band FM (NFM) signals. NFM is the mode
most commonly used above 30 MHz, whether for voice or
data transmissions. Regardless, if it's an NFM signal
of any type, the Discriminator converts that signal into
audio. It's low-level audio, but nevertheless audio.

If it's a voice signal, you'll hear and understand it
as this signal out of the Discriminator gets filtered
and amplified up to speaker volume levels. If it's a
data signal, well you'll hear that, too, but you won't
understand it. Data signals are raucous, nasty sounds
that'll send you scrambling to hit the SCAN or arrow
keys mighty quick.

BASEBAND AUDIO
==========

Unless, of course, decoding that data is among your interests. If
it is, then there are a couple more things you need to know. First,
this Discriminator Output signal is also known as the "baseband
audio". The chief characteristics of the baseband audio are
(1) low level, typically .2-.8 volts, AC), and (2) unfiltered.

Unfiltered? Well, yes. See, the human voice band is considered to
be 300 Hz - 3000 Hz. Signals above and below that range are not
considered essential to the successful transmission of voice, so to

simplify the design of the audio preamplifier and power amplifier in the receiver, and to cut down on noise and hash, cheap and simple filters are used to eliminate signals below and above that band. And for voice, it's no big deal. All communications receivers, including scanners have some kind of voice band filtering between the output of the detector/discriminator and the headphones or speaker.

DECODING DIGITAL DATA
=====================

Trouble is....data signals, especially high speed data above 2400-bits/sec (bps), have a bandwidth somewhat wider than the voice band. This simply means that you cannot successfully decode high speed data by tapping the signal off the speaker or headphone jacks. You have to take the signal for decoding right off the output of the Discriminator. Therefore, since decoding data is getting to be interesting and of wide appeal these days, you'll hear a lot of talk about "discriminator outputs" and "baseband audio taps"; one and the same thing.

DATA SLICERS or DECODER INTERFACES
==================================

Last, but not least, in order to decode data signals, you need a bit of extra hardware and some software. The software is more fully discussed in my regular article titled SCANNER DISCRIMINATOR DATA. The extra bit of hardware that's needed is referred to as a "data slicer" or, as I call it, a "Data Decoder Interface".

The Input of this decoder interface or data slicer is fed from the scanner's Discriminator Output. The Output of the decoder interface goes straight to one of the computer's COM or serial ports. Fire up the computer and the software; turn on the scanner and tune in a data channel, and you're in business.

For a circuit diagram and construction details, as well as how to identify and locate the Discriminator in your scanner, see my regular newsgroup article titled SCANNER DATA DECODER FAQ. That'll get you started on the cool, neat, fun world of decoding digital data off the airwaves. You can also get the file from my FTP site:

ftp://ftp.cts.com/pub/bcheek/faqs/scandata.faq

==========
19: How can I build a 'data slicer'?

Detailed instructions for that are in my FAQ file called SCANDATA.FAQ that's regularly posted on the scanner newsgroups and available for download at my FTP site:

ftp://ftp.cts.com/pub/bcheek/faqs/scandata.faq

==========
20: What if I don't want to build a 'data slicer'?

There isn't much of a technical obstacle to "rolling
your own Data Decoder Interface, but if lack of time,
tools, or access to the parts is an obstacle, then you
can acquire one in either of two ways:

8-pg Instruction Set (only) $5 ppd, $7 foreign

1. Kit of essential parts (you build it): $15 + $8 S&H

Includes:
3 ea Capacitor; tantalum; 10-uF/16v:
1 ea D-sub Plastic Hood/shell; DB25
1 ea DB25 connector; female; solder pin
2 ea Resistor; 100-k; 1/4-watt
1 ea Resistor; 3.3-k; 1/4-watt
4 ea Diode; silicon; 1N4148
1 ea Op-amp; LM741CN; 8-pin DIP
1 ea Perfboard; pre-cut, notched, trimmed to size
1 ea Shielded cable; 3-ft; w/RCA plug
1 ea Detailed printed instruction set, complete with
graphics, photos, tables, and "what if's"...
1 ea 3.5" floppy disk w/shareware & freeware decoder
programs and utilities.

Optional upgrade or add-on items:

* A. Shielded cable; 6-ft; w/RCA plug + $2.00
* B. Shielded cable; 12-ft; w/RCA plug + $4.00
C. Port Adapter; DB25 male-to-DB9 female + $7.50
(adapts 25-pin Interface to 9-pin comport)

* Instead of the standard 3-ft cable w/RCA plug

-=OR=-

2. Assembled/tested Decoder Interface $40 + $8 S&H

Includes:
1 ea Data Decoder Interface built into a DB25 shell
with standard 3-ft shielded cable w/RCA plug.
1 ea Detailed printed instruction set, complete with
graphics, photos, tables, and "what if's"...
1 ea 3.5" floppy disk w/shareware & freeware decoder
programs and utilities.

Optional upgrade or add-on items:

A. Built with 6-ft shielded cable and RCA plug + $2.00
B. Built with 12-ft shielded cable and RCA plug + $4.00
C. Port Adapter; DB25 male-to-DB9 female + $7.50
(adapts 25-pin Interface to 9-pin comport)
D. Custom enhancements/designs per your specs +$10/up

TO ORDER: Use e-mail, fax, or postal mail per the
information in my signature box below.
MC/VISA or M.O. preferred. Personal and
company checks okay, but shipment delayed
until bank clearance. No COD's and no
shipments to PO Boxes or mail drops. Alaska,
Hawaii and foreign shipping extra.

TERMS: All sales are final; no returns-no refunds.
30-day Performance Warranty on the Assembled/
Tested Decoder Interface is strictly limited to
Motorola SmartNet trunked data signals using
TRUNKER.EXE Repair or replacement at our
option during that 30-day period. No
warranty on Kits.

==========
21: What books have you written, generally what topics do
they cover, are they still in print, what do they cost,
and are they available to order at any web site?

BOOKS
=====
Scanner Modification Handbook, Vol-1, ISBN 0-939780-11-9
Scanner Modification Handbook, Vol-2, ISBN 0-939780-14-3
The Ultimate Scanner (Cheek3) ISBN 1-56866-058-8

Available from leading mail order radio dealers everywhere
as well as many radio shops and electronic supply houses.
Cost depends on the seller and I can't speak for them.

MONTHLY NEWSLETTER
==========
"The World Scanner Report"

The RS 20-014 base scanner antenna is a groundplane with three 6 ft horizontal radials and three vertical elements of different lengths. These elements make it multi-banded.

Bill Cheek's Scanner Data Decoding
Frequently Asked Questions File
============================================

Contents
=========
```

01: What is a 'Discriminator Output' and 'baseband audio'?
02: How can I find the Discriminator Output in my scanner?
03: How do I connect to the Discriminator Output?
04: How do I build or acquire a SIMPLE decoder interface?
05: How do I build or acquire a BETTER decoder interface?
06: So how do I decode digital data from the airwaves?
07: How can I decode CTCSS, DPL, and DTMF from the airwaves?
08: Is it possible to "TrunkTrack" without a TrunkTracker?
09: What if I don't want to build my own Data Decoder Interface?

Questions and Answers

==========
01: What is a 'Discriminator Output' and 'baseband audio'?

There is a growing interest in tapping the baseband audio out of various scanners for decoding of a variety of esoteric signals, including CTCSS, SCA, FSK, RTTY, FAX, Pager data, and trunked system control data, etc.

By and large, such signals cannot be taken from TAPE REC jacks, headphone jacks, and EXT SPEAKER jacks because of the voice-band filters that are between the signal source and these output jacks.

Therefore, it is necessary to tap the wider "baseband audio" directly at the output of the NFM discriminator chip in your scanner. This is the first step to successful data decoding from the airwaves.

==========
02: How can I find the Discriminator Output in my scanner?

Table 1 shows a list of scanners, the discriminator chip(s) used in the scanner, circuit symbols of those chips, and the baseband audio (discriminator output) pin.

If your scanner isn't listed in Table 1, then refer to Table 2 to find its discriminator chip. The chips listed in Table 2 are all known Discriminators used in scanners and wide coverage receivers.

Between Tables 1 and 2, you should be able to find the NFM discriminator and its output pin for any reasonably modern scanner.

Corrections and additions to these lists are requested. See my email and other addresses at the end of this file.

TABLE 1: SCANNER NFM DISCRIMINATOR CHIPS & PINS

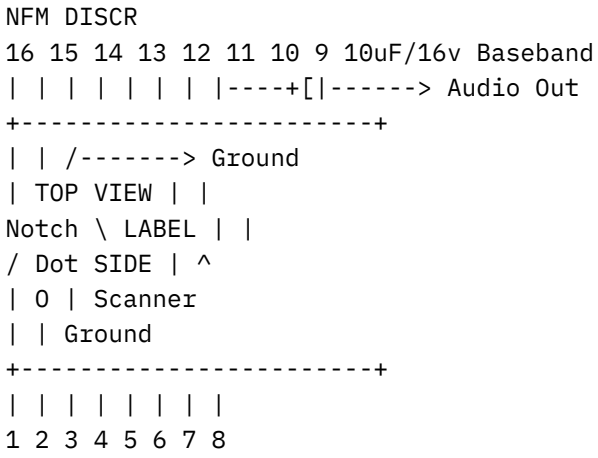
Once you locate the discriminator in your scanner, you have to make its output conveniently available on the exterior chassis, much like a headphone or tape recorder jack.

Figure 1 below shows how to determine the pin numbering system for most integrated circuits. Looking at the marking side of the chip, there is either a notch or nook at one end, and/or an embedded "dot" off to one side at one end. The notch, nook, or dot signifies the end that starts with

Pin #1 and ends with whatever the highest numbered pin
happens to be. Most IC's have 8, 14, 16, or 18 pins.

FIGURE 1
TYPICAL NFM IC CHIP PINOUT



NOTE: Figure 1 shows the baseband audio tap on Pin 9,
though the pin number will vary from one chip
to the next.

==========
03: How do I connect to the Discriminator Output?

HOOKUP PROCEDURE
==========

If you need the raw NFM Discriminator baseband audio signal
for external purposes, the best way to access it is via a
jack installed in a convenient, unobtrusive location on the
scanner. Use Figure 1 as a general guide.

1A BASE SCANNERS: Install an RCA or other jack in a desired
place on the scanner's external case, typically the rear
panel.

1B HANDHELD SCANNERS: If you can find the space, use a
standard monaural 1/8" phone jack or a 3/32" mini phone
jack. Some scanners are so cramped inside that even
these won't fit. In that case a strip of 3 pinline
sockets can be melted into the plastic case and wires
soldered to the inside protrusions.

The middle pinline socket is not connected to anything;
it's just there as strength and support for the pinline
plug you make, with the shield ground soldered to one
end and the audio- center soldered to the other end:

GND---o o o---NFM DSCR (audio)

"Break-apart" pinline plugs/sockets are available from
Mouser, DigiKey, and Hosfelt.

Digi-Key: p/n A208-ND (800) 344-4539
Hosfelt: p/n 21-274 (800) 524-6464
Mouser: p/n 151-5520/5530 (800) 346-6873

These little puppies are good for a lot of hacker needs,
so get a supply!

2. Connect the shell or outer frame part of the jack to
scanner chassis ground. (Use one end socket for pinline
connections)

3. Connect the (+) leg of a 10-uF tantalum capacitor (Radio
Shack #272-1436) to the Discriminator output Pin. (Capacitor
should be tantalum, but can vary in value from 2.2-uF to
10-uF at a voltage rating of 16-35 vdc.)

4. Connect the center conductor of a shielded coax (RG-174,
etc) or shielded mic cable to the (-) leg of the
capacitor. NOTE: if the distance from the NFM tap to the
jack is less than 3", then a single unshielded hookup
wire will do fine.

5. Connect the shield of the cable at this end to a nearby
PCB ground trace or spot.

6. Connect the center conductor of the other end of this
cable (or single hookup wire) to the center or hot lug
of the jack.

7. Connect the shield of the cable at that end to the
ground lug of the jack.

8. Fabricate or buy a shielded patch cable with one end to
mate with the new jack on the rear of the scanner at
that end....and the other end to mate with whatever jack
is on the tape recorder, processor, decoder, or whatever
device is to be connected at the other end.

Now you are ready to connect a data decoder interface to the
baseband audio output jack. See Figure 1 above.

==========
04: How do I build or acquire a simple decoder interface circuit?

If you want to decode trunk control, MDT, some pager, fax and/or
other digital signals, you will need to build or buy a simple
2-Level FSK Interface to go between the NFM Discriminator/
Baseband Audio of the scanner and a standard PC serial port.

See Question #5 for a more sophisticated 4-Level FSK Interface.

If you are not capable of building your own, or if you
don't have the time to mess with it, I can supply either

a Kit of all essential parts and detailed instructions, and you build it yourself, OR I can supply an assembled/ tested Decoder Interface, built inside a DB-25 shell and connector with a 3 ft shielded cable terminated with an RCA plug. See Question #9 for details.

The DB-25 shell connects directly to a DB-25 comport on the PC, or, if your comports are DB-9's, you can get a DB25-to-DB9 adapter for it. You should, however, be able to make your own following the below instructions.

This is a tried and true Data Interface circuit that's good for everything we've tried, including a wide variety of scanners. External power is not required. This circuit draws its power from the comport. It is similar to the "Hamcom" and "data slicer" interfaces, but is optimized for more scanners and more applications.

2-LEVEL DATA DECODER INTERFACE SCHEMATIC DIAGRAM

^ ^ (See Note 10 and Q&A #8)
Gnd RxD
COM3
or other
port for Trunk
Follower control
```

LEGEND:

```
|
--o-- = soldered connection/junction
```

```
--o = turn of the trace in the drawing
|
```

```
--|-- = crossover (no connection)
+|[ = capacitor, polarized (note the +)
>| = diode (anode->|-cathode)
|< = diode (cathode-|<-anode)
-/\/\/- = resistor
-->>> = ground
```

NOTES:
1. Use tantalum capacitors, +|[polarity as shown

2. Radio Shack's LM-741 op-amp works fine. Others might not!

3. Use 1/4 or 1/8 watt resistors to conserve space

4. Build circuit on a trimmed and fitted piece of perf board inside a DB-25 shell for max efficiency and space savings. DB-25 connects to PC's comport and a shielded cable from the scanner goes to the input; shield is ground and center is audio.

Hi-res laser printed Instruction Sets available with precise schematics, drawings, perfboard layout, graphics, wiring, and solder points. Inquire: bcheek@cts.com or see:

http://ourworld.compuserve.com/homepages/bcheek/decode.htm

5. Many handheld scanners have no space to install a phone jack for the NFM Discriminator Output. For such tight spaces a strip of 3 pinline sockets can be melted into the plastic case and wires soldered to the inside protrusions. The middle pinline socket is not connected to anything; it's just there as strength and support for the pinline plug you make, with the shield ground soldered to one end and the audio-center soldered to the other end:

GND---o o o---NFM DSCR (audio)

6. For base scanners, install a female RCA jack on rear panel.

7. For handheld scanners where there is space, use a 3/32" mini or a 1/8" standard monaural phone plug.

8. 3.3k is an optimized value for most scanners. If the baseband audio output measures less than 0.350-V AC, with a voltmeter set to AC-volts at a 1v range, you should decrease the 3.3k resistor to 2.2k, or even 1k if if the measurement is under 0.250v AC.

I measured 0.150v AC out of the baseband audio tap in a Sony ICF-SC1PC handheld scanner. The required resistor from U1 Pin 3 to ground worked out to 1k.

The NFM baseband audio signal of most scanners should show 0.400v AC or higher, in which case the 3.3k resistor is just right.

9. Connect the interface to a comport on the PC. Plug the input cable in to the scanner's NFM Discriminator Output Jack. Tune to a desired signal and run the decoder software of your choice.

10. If you are interested in using the "data decode" scanner to control or "TrunkFollow" a second scanner, then run a pair of wires off the Data Decoder Interface from unused TxD (Pin 2) and Ground (Pin 7) out the back of the circuit. This pair of wires will feed the RxD and Ground pins of another COMport on the PC.

==========

05: How do I build or acquire a BETTER decoder interface?

First, understand that you may not need or want a "better" decoder interface. The 2-Level Data Decoder Interface given just above is ample for most everything except "FLEX" and ReFLEX" pager signals. There may be other exceptions, but they are few and far between. In most cases, the simpler 2-Level FSK Data Decoder Interface will be all you need.

Secondly, understand that the more sophisticated 4-Level FSK Data Decoder Interface cannot and does not replace the simpler 2-Level version. If you want the 4-Level interface, that's fine, but you'll need the 2-Level, too.

If you are not capable of building your own, or if you don't have the time to mess with it, I can supply either a Kit of all essential parts and detailed instructions, and you build it yourself,

OR

I can supply an assembled/ tested 4-Level Data Decoder Interface, built inside a project box with a DB-9 output jack on one end and an RCA jack on the other end. You will need to provide your own shielded cable terminated with an RCA plug on one end to mate to the box and whatever connector on the other end to connect to the NFM Discriminator Baseband Audio Output on your scanner.

You will also need to provide a shielded straight-thru 9-cond serial cable with a male DB9 plug on one end to mate to the 4LFSKDDI box and whatever connector on the other end to mate to the chosen PC serial port.

You may also have to provide your own +/- dual polarity power supply. (Two 9v batteries can suffice.) See Question #9 for more details.

I'm not sure yet how to present the 4-Level FSK Data Decoder Interface circuit as a plain ASCII schematic like shown above for the simpler 2LFSKDDI circuit. So for now, I have to refer you to the Web Sites that support this circuit with graphics, text, and/or software support. You should research these sites:

http://www.geocities.com/SiliconValley/Horizon/6063/
http://www.qsl.net/pa3eik/4lev_fsk.htm
http://www.geocities.com/CapeCanaveral/Launchpad/4039/
http://www.geocities.com/CapeCanaveral/Launchpad/4039/PINFO.HTM
http://www.geocities.com/CapeCanaveral/Launchpad/4039/IINFO.HTM
http://www.geocities.com/CapeCanaveral/Launchpad/4039/POCFLEX.ZIP
http://www.geocities.com/ResearchTriangle/Lab/9339/
http://www.geocities.com/SiliconValley/Network/8916/4levelm.gif

I now have available a detailed Instruction Set on the 4LFSKDDI for those who find the above sites a little too technical to handle. I can also provide Kits of essential parts, less enclosure and power supply. See Q&A #9.

==========
06: So how do I decode digital data from the airwaves?

First, you tap the Discriminator Output in your scanner. Then build the desired Data Decoder Interface and connect it to the Discriminator Output. Then connect the other side of the Decoder Interface to a com/serial port on your PC. Lastly, run the software that decodes the particular type of signal that you want to decode.

In general, it takes different software for different kinds of signals, and I can't possibly cover them all here. I will suggest that you start out with a free program called TRUNKER that decodes the control data of Motorola trunking systems. This is one of the easiest to set up and get working; therefore, it makes a good test "platform" to prove up all your work before you

venture into bigger and better things. Motorola trunk systems are fairly common now.

TRUNKER and a good set of documentation and limited support for it can be found at the following Web Sites:

http://www.geocities.com/CapeCanaveral/Lab/1060/beta.htm

or

http://web2.airmail.net/lblant1/dfw/digital.htm

Apparently it is possible to decode certain kinds of data from the airwaves without a decoder interface - just software! For info on decoding MDT signals with nothing more than a Windows PC and a sound card, check out:

http://www.geocities.com/ResearchTriangle/Facility/7646/

==========

07: How can I decode CTCSS, DPL, and DTMF from the airwaves?

That is strictly up to specialized hardware and/or software that kind of goes beyond the scope of this FAQ. Lots of software is out and about that will do it, and there are even possibilities for "roll your own" hardware decoders.

But the first thing you'll need is the "baseband audio" output that is described in Questions/Answers #1-3 above. The Data Decoder Interface described in Q/A #4 is good ONLY for trunking and pager types of data; not CTCSS, DPL, and DTMF, unfortunately.

In fact, it takes specialized hardware and/or software to decode each of CTCSS, DPL, and DTMF; and each is as different as night and day.

Some scanners come equipped for CTCSS decoding, but most do not. And none come equipped for DPL or DTMF that I know of.

For more information about retrofitting CTCSS and DPL decoders to your scanner, contact:

Communications Specialists, Inc.
426 West Taft Avenue
Orange, CA 92865-4296
(800) 854-0547 Fax (800) 850-0547
(714) 998-3021 Fax (714) 974-3420
WEB: http://www.com-spec.com/

For a low-cost "roll-your-own" DTMF Decoder (hardware) there is a nice project done up in great detail in one of the back issues of the monthly WORLD SCANNER REPORT

newsletter, V3N10. Backissues are always available at a nominal cost. See:

ftp://ftp.cts.com/pub/bcheek/products/prodinfo.zip

There are other hardware and software solutions for decoding DTMF that I may include here later as I get the information verified and added.

The WiNRADiO Digital Suite is awesomely capable of decoding CTCSS and DTMF. See: http://www.winradio.com

For scanners in general, though, it all starts with a tap to the "baseband audio" point, so read over Q&A 1-3 above for the details.

==
08: Is it possible to "TrunkTrack" without a TrunkTracker?

It didn't used to be, but times do change and YES! It is now possible to track the trunks without a 'real' TrunkTracker Scanner, and better, for that matter!!!

Like the other subjects in this FAQ, it all begins with a Data Decoder Interface. See Q&A #4 and Note 10 in that answer for the tiny extra addition you need to make to the Decoder Interface.

Next, you need a PRO-2004, PRO-2005, or PRO-2006 scanner, although we hope to add other scanners to the list in due time. For now, it's one of those three.

NOTE: It is possible to track the trunks with a AR-8000 and perhaps with one of the Opto Interfaces, but these are specialized situations where detailed info must be found elsewhere.

Then you need a CE-232 Scanner/Computer Interface (or its predecessor, the HB-232). You will also need the hot, new Windows program for the CE/HB-232 called Pro-Turbo.

Lastly, you need one fairly modern computer, Pentium 133 or better, for the easiest way to track the trunks, but there is another way almost as easy, if you have two computers, one a 486DX2/66 or better and the other, a PC-386 or better.

There are other requirements, too, but the above are the main ones. It is beyond the scope of this FAQ to spell out all the details, but the V8N9 issue of the monthly World Scanner Report tells it all. You can order this or any other back issue of the World Scanner Report since Jan-91, including 6-mo and 1-yr subscriptions.

You can also download a more detailed text file on
TrunkFollowing with the PRO-2004/5/6 from my FTP site at:

ftp://ftp.cts.com/pub/bcheek/ce-232/trnkscan.txt

For more information on the Pro-Turbo software for the
HB/CE-232, contact:

Paul E. Turton
RR # 3; Wainfleet, Ontario Canada L0S 1V0
E-mail: pturton@iaw.on.ca or jabba@iaw.on.ca
Web: http://www.iaw.on.ca/~jabba/pro-turbo.htm

For more information on the CE-232 Interface, you can
download a file called PRODINFO.ZIP from:

ftp://ftp.cts.com/pub/bcheek/products

or you can view and download all the individual files
from the \CE-232 directory. Or, you can ask for it as
an e-mail file attachment from: bcheek@cts.com

or see the information in my signature box below.

But yes, it is now possible to track the trunks without
a TrunkTracker scanner, and do it better than any of the
"real" TrunkTracker scanners! The cost can be a lot
less than the cost of a real TrunkTracker, too. The cost
largely depends on what you already have, or can
scrounge up, but at worst, it's well within the budget
of many scannists.

==========
09: What if I don't want to build my own Data Decoder Interface?

See further below if you are intested in a 4-Level Data
Decoder Interface. First is info on the 2LFSKDDI:

2LFSKDDI
========

There isn't much of a technical obstacle to "rolling your
own 2-Level Data Decoder Interface, but if lack of time,
tools, or access to the parts is an obstacle, then you can
acquire one in either of two ways:

NOTE: We can supply the 2LFSKDDI detailed Instruction Set
alone for $5, ppd, USA and $7, ppd, foreign.

1. Kit of essential parts (you build it): $15 + $8 S&H

Includes:
3 ea Capacitor; tantalum; 10-uF/16v:
1 ea D-sub Plastic Hood/shell; DB25
1 ea DB25 connector; female; solder pin
2 ea Resistor; 100-k; 1/4-watt

1 ea Resistor; 3.3-k; 1/4-watt
4 ea Diode; silicon; 1N4148
1 ea Op-amp; LM741CN; 8-pin DIP
1 ea Perfboard; pre-cut, notched, trimmed to size
1 ea Shielded cable; 3-ft; w/RCA plug
1 ea Detailed printed instruction set, complete with
graphics, photos, tables, and "what if's"...
1 ea 3.5" floppy disk w/shareware & freeware decoder
programs and utilities.

Optional upgrade or add-on items:

* A. Shielded cable; 6-ft; w/RCA plug + $2.00
* B. Shielded cable; 12-ft; w/RCA plug + $4.00
C. Port Adapter; DB25 male-to-DB9 female + $7.50
(adapts 25-pin Interface to 9-pin comport)

* Instead of the standard 3-ft cable w/RCA plug

-=OR=-

2. Assembled/tested 2-L Decoder Interface $40 + $8 S&H

Includes:
1 ea Data Decoder Interface built into a DB25 shell
with standard 3-ft shielded cable w/RCA plug.
1 ea Detailed printed instruction set, complete with
graphics, photos, tables, and "what if's"...
1 ea 3.5" floppy disk w/shareware & freeware decoder
programs and utilities.

Optional upgrade or add-on items:

A. Built with 6-ft shielded cable and RCA plug + $2.00
B. Built with 12-ft shielded cable and RCA plug + $4.00
C. Port Adapter; DB25 male-to-DB9 female + $7.50
(adapts 25-pin Interface to 9-pin comport)
D. Custom enhancements/designs per your specs +$10/up

4LFSKDDI
========

CAVEAT: It may be illegal to decode certain 4LFSK signals.
You must determine that for your self and cease
interest in the subject if not legal in your area.

If you are intested in a 4-Level FSK Data Decoder Interface
we have a detailed Instruction Set ready to go, as well as a
Kit of Essential parts, less enclosure and power supply.

Assembled and Tested units are not ready yet, but.....I may
have available some built/tested prototype units that have
been proved fit for consumption.

One or more of the following may be available:

1. Instruction Set Only - you build from it.
8-pages of hi-res laser printed text, charts,
photos, drawings, and detailed, hand-holding
guidance: Price: $5, ppd, USA; $7, ppd, foreign

2. Kit of Essential Parts, plus detailed Instruction Set
from (1) above, less enclosure and power supply. See my
4LFSK.FAQ file for details, or the following web site:

http://ourworld.compuserve.com/homepages/bcheek/4lfsk.txt

Price: $20 + $8 S&H, USA; $20 + $15 S&H foreign

3. Kit of Essential Parts, incl power supply. Price: TBA
4. Assembled/Tested 4LFSKDDI, less power supply. Price: TBA
5. Assembled/Tested 4LFSKDDI, incl power supply. Price: TBA

TO ORDER: Use e-mail, fax, or postal mail per the
information in my signature box below. MC/VISA or
M.O. preferred. Personal and company checks okay,
but shipment delayed until bank clearance. No
COD's and no shipments to PO Boxes or mail drops.
Alaska, Hawaii and foreign shipping extra.

TERMS: All sales are final; no returns-no refunds. 30-day
Performance Warranty on the Assembled/ Tested
Decoder Interface is strictly limited to Motorola
SmartNet trunked data signals using TRUNKER.EXE
despite that it will work on many other kinds of
data, too. We just can't support it all. Repair
or replacement at our option during that 30-day
period. No warranty on Kits.

527. URGENT: -Data Decoder FAQ Update-

Newsgroup: rec.radio.scanner
Date: 1999-02-06 00:00:00 UTC
From: bcheek@cts.com
Message-ID: <36bf5e7e.75563744@news2.cts.com>
Source record: 128498
Cross-posted to: rec.radio.scanner,alt.radio.scanner

2-6-99

NOTICE OF CERTAIN DATA DECODER LIMITATIONS
(and a fix!)
==========

My SCANDATA.FAQ and related periodic newsgroup posts on data decoding attempt to define a 2 Level FSK Data Decoder Interface that will work on a majority of all scanners.

And it does. But there are probably a few scanners with which it won't work as designed. I just discovered one, the Sony ICF-SC1PC. And I learned why the 2LFSKDDI didn't work, and what to do about it. First, the cause and why a few other scanners may be affected.

When a known good 2LFSKDDI wouldn't work on my Sony ICF-SC1PC, I immediately measured the RMS value of the baseband audio signal, and much to my dismay it was 0.150 volts (AC). Aha!

Oddly enough, that same scanner worked fine with a 4 Level FSK Data Decoder Interface! Of course, it has GAIN to overcome weak signal inputs, so that was clue enough.

The baseband audio output of most scanners I have ever measured runs from 0.350v to 0.800v, so that's the range for which I optimized the design of the 2LFSKDDI that I regularly post on the newsgroups and in my SCANDATA.FAQ file.

http://ourworld.compuserve.com/homepages/bcheek/scandata.txt

Extensive tests proved that the Sony ICF-SC1PC was not defective in any manner; it just has a low level NFM discriminator signal. If one scanner has a markedly low signal, then others might, too. Here's how to find out about yours:

Connect a voltmeter (set to the AC-volts function at a range of about 1-volts) to the baseband audio output jack on your scanner. Tune the scanner to a known trunked data control signal (855-868 MHz).

Record the measured voltage. If 0.350 VAC or
better, then the 2LFSKDDI as presented in my FAQ
and newsgroup posts will work just fine. But what
if the signal is less than 0.350v?

The 2LFSKDDI weak-signal fix is simple. Change
the 3.3k resistor (at U1 Pin 3 to ground) to 2.2k
if the signal is between 0.250-0.350v.

If the signal is weaker than 0.250v, then change
that 3.3k resistor to 1k. Easy as that. 1-2-3.

OPTION: You could build your 2LFSKDDI with a 10k
trimmer potentiometer in place of that
resistor, so as to make the one decoder
interface serve a variety of scanners.
A 1/4" hole drilled in the DB25 shell just
over the trip pot adjustment will let you
tweak it for optimum performance at any time.

U1 Pin 3 >----o----/\/\/\-----o----> Ground
^ |
| |
o-------/

Just wire the trim pot as a variable resistor.

NOTE: Some "data slicers" and "hamcom" interfaces
might call for a 10-k resistor in place of
my 3.3k. This only makes the 2LFSKDDI more
prone to weak-signal failure.

NOTE: Other "data slicers" and "hamcom" interface
designs go for the simplicity by eliminating
that one resistor by grounding Pin 3 of U1.
These designs might also eliminate another
resistor, too. Granted, these designs will
decode practically any level of signal......
.......including.....NOISE! The purpose of
the 3.3k resistor is to set a threshhold above
the noise for improved accuracy. So it is
essential, in my opinion. Just that depending
on the output level of your baseband audio,
the optimum value of that resistor might be
anywhere from 1k to 10k. For most scanners,
it remains 3.3k.

CAVEAT: Before going off half-cocked, make sure
there is nothing amiss with your Baseband Audio
modification. Errors and incorrect installations
can cause weak signals, too. The correct mod
has the (+) leg of a 2.2-uF to 10-uF tantalum
capacitor soldered to the NFM Discriminator audio

output pin. The (-) leg of this capacitor goes out via a hookup wire or shielded cable to the hot lead or center lead of the jack on your scanner that serves as the baseband audio output. The shell or outer lug of the jack should be grounded to scanner ground. The shield of the shielded cable must also be soldered to the ground lug.

If...and only if....your baseband audio mod was properly done, and then if the signal is weaker than 0.350 VAC, you can alter the design of the 2LFSKDDI as indicated above, for good results.

I've driven past the Pantages Theater in Hollywood on Hollywood blvd near Vine
and have seen
Film production crews doing something there. I had my scanner with me and was
trying to locate the frequency they were using. My friend went into the nearby
subway while I stayed in the truck

anyone have any ideas on what frequencies are popular for film crews to use!

I have an AOR-8000 scanner so I shouldn't have any problem picking up the right
frequency.
I also have a roof mounted antenna which makes it interesting when I go into
some parking structures. The antenna will strike the low hanging support beams

I would start by searching the following frequencies first:

152.870
152.900
152.930
152.960
152.990
153.020
173.225
173.275
173.325
173.375

From: D Stark <dave@nf2g.com>
Message-ID: <V90v2.2109$Ba.2930@newsr1.twcny.rr.com>
Source record: 128512

I downloaded the "new" version 1.4.1 of MDT Monitor from the website that was posted here earlier. During setup, I got a couple of dialog boxes indicating that the components already on my drive were NEWER than the ones in the archive, including the main executable. Whether I use the new MDTMon.exe or the old one, the "Help->About" information shows version 1.1.1.

What's up with that?

I monitor the Glendale Arizona trunked system AND their MDT system (it's mdc4800, so MDTMonitor fits the bill nicely). The point is I can tell you that you're not missing much by not monitoring the CAD system *usually*. 90% of the time it's used to run records checks on people and/or their vehicles, and routine calls like audible alarms and other routine nonsense. All of the hot traffic like say, a robbery in progress or traffic accidents for example, are dispatched via both voice and CAD. I have to say being able to read the call as the dispatcher voices it out is very, very cool.

Of course there are exceptions to the rule, like the time a call came out on the CAD system that never made it to the voice channels. A teenage couple apparently decided that the place to consummate their relationship was outside. On top of his truck. In some one else's driveway. On NEW YEARS EVE, no less!!! Needless to say the CAD system was overflowing with jokes and crude remarks for the rest of the night, and since the officers responding had a video camera on the dashboard, the incident remained the talk of the town for several days as other officers "reviewed the evidence, wink, wink." Unreal...

First, I want to inform you of a very sad fact : It is LEGAL for the phone company to "tap" your lines anytime it wants to. No, I did not misunderstand your question, I just want you to know this.

It is, however ILLEGAL for anyone ELSE to tap your phone lines without a court order authorizing them to do so (usually the police will obtain this if they can convince a judge that there is "other evidence" warranting the tap)

Yes, the phone company can be helpful in locating a tap on your line. A direct tap will throw the resistance off, and this can be detected with resistance checks right from the company office. Also, the line will be drawing more current than it should. However, they CAN be somewhat less than helpful if THEY are the ones doing the line tap. This would be your furst clue, would be a lack of willingness to cooperate with you.

A direct tap is just that: One actually connects the wires from a phone used for monnitoring directly to the red and green wires on your line. When your phone rings, his does too, and he picks up and listens. (Just like an extension in your own house.) There is, however, another kind of tap. This is called the "Infinity" tap and uses a small radio transmitter to transmit the phone conversation to a nearby reciever. It is still clipped onto your phone wires, but does not need a direct wire for listening, since the conversation is transmitted over the air waves. What you need is a fairly sensitive field strength meter to detect this. Have a friend call you, and just have him sit on the connection while you take the field strength meter and check for radiation around your phone box, and maybe out near the pole near the street. Check anywhere there are exposed phone wires that could have been tapped. If you get radiated RF during the call, but when he hangs up, the radiated RF drops to nothing, then you got a bug.

>
>Just a thought...
>
>Dave
>dtscho@wm.edu
>
>Hi There Dave,

Only one problem with your suggestion.....The use of multiple CTCSS tones
on one radio frequency has been around for years.
The problem is that when one user is keyed up using their tone to call a
member of the same group, every one else has to wait in turn to use the
channel. The other users with differing tones will not hear any activity,
but there will be an indicator on their radio set lit to say that the
channel is in use. Also their radio's may not transmit when a signal is
present, this is called transmit inhibit. Users simply have to share airtime
as there is only one radio frequency to use at any one time.
Any radio user with experience in this type of system will tell you that it
is most frustrating when you have to speak and can't.
Trunking solves all this by having a group of channels availiable to all the
users in the system, so when one group is chatting away, there still remains
several others free for use by everyone else.
A computer decides which frequency to send the radio's to, so no-one has to

change channels or wait to speak....with trunking, the avaliable channels should always excede the total number of users.

I hope I havent gone on for too long and lost you in the explanation, but I can tell you from experience, trunking is so much better to use than the older conventional single frequency, multi CTCSS system.

I actually service and maintain a trunked system in a large entertainment complex with 30 channels and over 1500 users.
Lots of fun for me, but for the scanner user, a horrible time trying to keep track of one particular user.

KEEP SCANNING.....Big A

569. Re: No Service Manual

Newsgroup: rec.radio.scanner
Date: 1999-02-06 00:00:00 UTC
From: richard lamprey <rlamprey@worldnet.att.net>
Message-ID: <01be5182$51988160$de624c0c@default>
Source record: 128607

Hi Alan,
I had a similar experience a while back. The sales person at radio shack said the
technical manuals were not available to the public. Shortly thereafter I noticed
that radio shack had a set of binders on display which included many items
not on display, and not in the catalog. It contains a list of all radio shack items
and component parts. A quick check of the scanner I wanted to repair showed
the part number of the tech service manual. I simply called the radio shack
800 number and ordered via the part number. Delivery was very prompt.

I have used this service several times but some items that are not Radio Shack
brands do not have service manuals available. You will have to use other sources
for these service repair manuals.

Hope this helps.

Richard

Well, I took a lot of your advice and purchased an FM filter. When I went up to my attic to install the filter I brought along my scanner and placed the scanner at the end of the antenna (no pre-amp). I still picked up the horrible backround radio station. I then hooked up the notch filter and WOW! Total silence. I placed the pre-amp back in line and went down and had a listen. My reception is great, no more noise. Thanks for all your help.

fyi, the notch filter I purchased frequency specifications were 88-108 MHz with 60 dB attenuation at 98 MHz. Insertion loss was < 1dB from Stridsberg (no affiliation).

From: mdtmon@hotmail.com
Message-ID: <79gh8r$5v5$1@nnrp1.dejanews.com>
Source record: 128615

This latest version of MDT Monitor now allows you to capture all data and send it to the printer or send only traffic matching your rules to the printer.

MDT Monitor is a Windows program that allows you to monitor MDT traffic on systems that use Motorola's MDC-4800 protocol. To use this program you'll need a scanner with a discriminator output, a Windows PC (running Win95, Win98, or WinNT 4.0), and either a sound card, a HamComm-type data slicer, or an RM100 decoder.

The program (and source code) are available at
http://www.geocities.com/ResearchTriangle/Facility/7646/index.html

I have this uniden 30 ch handheld. it is a year old and has the
original rubber antenna. are these antennas junk or what? the only
thing i can pick up is a 911 center about 3 miles from home. i can only
get a patrol car if it is on my street. anyone have any thoughts on
this subject??????????????????

Similar to the "wooden dowel approach above....

..use an Aluminum dowel with a vinyl tube slid over the dowel.

My experience with the purchase of a truncking radio have been the pits. When my city went to trunking, I thought purchasing a Trunk Tracker would be the answer to my problems.. Problem is - when they went to trunk, they also went to dispatching via computer (CAD). Now I have a radio to follow their system, and very little voice traffic ON the system. If you can, try to find out what your city/county plans are for dispatching in the future.

The ground plane with three radials....picked up two more today for another 10$ in change....a friend of mine has plans to make a nice 6 , 2 and 440 vertical out of two of them...I now have one up for the scanner and it really recieves well....I am gonna pick up some more and tailgate them at the hamfest this spring! I should triple my money!

Get em while they are hot!

I hope radio hack closes out some more stuff real soon....

My area Columbus Ohio also supposedly dispatches by MDT. In reality,
this isn't always the case. Plus, of course, if there is some hot
action, an officer cannot type as he is chasing someone.... when
something bad occurs you will be assurred that they will use voice.

This is where the joke ends with you.

The reason John has SHUT UP, or so he SHOULD) is because all is not as it would appear. IF you were right, he'd be chimin' in like usual, now WOULDN'T HE? Even a FOOL should see THAT

HAHAHA

But NO, I hold the TRUMP CARD in this game, and John KNOWS IT!!!!!!!!!!

Yes, this call belongs to that asshole Nick, who jammed on here a year ago with John, and on whom I hold EQUALLY damaging evidence.

Needless to say, he's GONE. Doesn't like me using this call, but I SURE wish I saw the look on MACKEY's face when he saw that message <G>

Yeah, I saw MACKEY's response to your message, and he'd BETTER SHUT UP, unless he wants someone like Sal Gambino calling him at work.

Would THAT get the point across?

On a lighter side, I must say this group looks much nicer lately. I'll stick around a week or so, but ya'll should be pretty safe from JOHNNYBOY now, 'less he wants TROUBLE.

As for the rest of the group, can't be quiet 'till LOON's like you (PHIL) shut up AS WELL!

Dolph,

There are MANY ways to bug a phone, some of them are done miles away from the house. If you think your phones are bugged, use that info to have some fun. Start giving false info over the phone, you know, something that SOUNDS good, but can be proved beyond a doubt by you to be false. If you play your cards right, they will tell YOU if they bugged your phone by there actions.

Good Luck,
Charlie

Most frequency counters will detect a transmitter at a range of a few inches to maybe 15 feet depending on the power of the transmitter. Maybe a little more if the transmitter is running 20 or more watts. Then it will read this out on a display similar to a calculator. They are not really a spy device, but are used to set the frequency of transmitters. They can be used to find the frequency of a close by transmitter. Some are small , maybe an inch thick and 4 or 5 inches square,a nd battery powered.

Texas 2-Way has 4-level decoders for much less! They include a nice box and only require a single polarity power supply like you can buy at radio shack for $12 (no messing with batteries!). Mine works great and it was super easy to hook up.

You can call them at (956)702-2481 or email them at n5sim@aol.com

I bought one from Texas 2-Way for a lot less than you can get them from Bill! Mine came with a box and it was easy to connect. It only needed a single polarity power supply - easy to get at Radio Shack for like $12. It works great!

You can call Texas 2-Way at (956)702-2481 or email them at n5sim@aol.com

Source record: 128344

I own and AR-8000 and an Optolinks interface. The Optolinks manual
mentions briefly that it can act as a data slicer but doesn't go into
any detail so I have some questions:
1. Is it a 2 level or 4 level slicer?
2. If I hook up my AR-8000 using the FFC (flat flexible cable) am I
providing baseband (descriminator) output to the data slicer?
3. Should I be able to use this arrangement to decode data such as MDT,

pager, packet, etc?
All help and advice will be greatly appreciated.

Hi,
I just acquired a scanner from by brother its a uniden bc 855 xlt I live in Hayward California and I purchased a outside antenna for it.. I was wondering if anyone knows the freq. for the Union City, Hayward, Oakland, police and here is a long shot but I was trying to get the freq. for AAA (American Automobile Association) (Triple A). My apartment has a fire wall so I figured the outside antenna would help.

Sabrina.

P.S.
I was thinking about purchasing a newer model.. I trying to keep it in a price range of $199.00 to maybe $250.00 any suggestions.

I have a DJ-X10 and experienced the same problem with the preprogrammed freqs. There I nothing that can be done except reprogram them individually. It's hard to understand how Alinco allowed this glitch to occur without a fix. I ultimately got rid of all those freqs and started over since many of them were of no interest to me.

I agree with your postive comments about the radio. It does have a few things I don't like such as the squelch setup but overall I think it's a great all in one radio. I wish there were more software available for it.ie Scancat.

Do you have a neighborhood watch program in your city? If you do, go to the meetings and just ask the officer there what they are. In my city (Englewood, Co.) they are more than happy to share information with the public, after all they work for us.

Bob

Its stupid to use a cordless phone?
Why? Its no different that talking to someone in a public place.
Talking about private personal issues or giving credit card numbers on a
cordless isn't very bright, I'll give you that.

>phones for an extended period of time?

Well, considering that these phones are using about the same frequency spectrum
as your microwave oven...you figure it out.

Anyone who repeatedly uses a 900Mhz cordless or handheld cellular phone is
either very ignorant or very foolish, in my opinion. Wait about 20 years and
see what the long-term effects are. I predict a large epidemic of various
cancers, located in the head.

"Where's that big 'ol CB RAMBO??"

I been reading lot of talk, on which 900mhz phone is the best, everyone seems to like their own phone, with no clear winner .... anyway my choice was the V-Tech 914 because of price ($69.00), and it was junk as expected, the autochannel changing happened every 30 to 60 seconds, click .. click. I returned that and bought a Panasonic TCM939-B, very nice phone, I love it, but there is one bit of information I can't find out.

Is this phone Digital Spread Spectrum?

I was going to return it after being at a friends house and witnessing his scanner pick up all sorts of phone converstations.... But then this week I saw a Circuit City ad saying this WAS Digital Spread Spectrum. I went to Panasonic's site .. which sucks for detailed infomation. In their product descriptions.. I would say no... only 2.4ghz phones use DSS... but they also mention their 900MHZ DSS phones... WHICH ONES??... none of the 900MHZ advertise this. Can anyone shed any light on this situation???

If by "tap" you mean listen in to your calls and optionally disclose
their content to a third party then I'm very surprised. Where exactly is
it legal for a phone company to do that?

>A direct tap is just that: One actually connects the wires from a phone used
>for monnitoring directly to the red and green wires on your line. When your
>phone rings, his does too, and he picks up and listens.

That's gotta be the dumbest possible way to tap someone's phone. So
stupid in fact that I can't imagine anyone doing a bit of spying would
do it. You're right about it being easy to detect but if no one uses
that method then easy detection of the method doesn't help the victim
much.

The simple truth is that even relatively cheap and nasty telephone
recording units used for bugging are all but impossible to detect
electronically and a thorough physical search of the entire reticulation
system must be carried out in order to discover them.

>There is, however, another kind of tap. This is called the "Infinity"
>tap and uses a small radio transmitter to transmit the phone conversation
>to a nearby reciever.

An infinity transmitter is a totally different type of device to the
device you've just described. An infinity transmitter is in fact not
meant to allow the spy to listen in to the phone conversations at all.
It is a room bugging device which uses the telephone line as a
transmission medium.

Or get a frequency counter. If you are within a hundred feet, even a cheap one like the opto Techtoyz with an 18inch wire antenna will immediately zero in on what frequency.

If money is no object, get the Opto Scout and a cable to reaction tune the AOR

>*** I have a high-gain antenna designed for *300-380mHz* and when I use >my BC9000 it picks up no cellular phones at all.***

The cell fones are not at 300 - 380 mHz.
The BC9000xlt thinks they are. The cell
fones are @ thier 800 mHz freqs, but
"leaking" thru to the mil air band
INSIDE the BC9000xlt. Sooo, you need an
800 mHz antenna as if you were recieving
the cell fones on the correct freq. Also
insure you have reset the mode to NFM &
5 kHz steps.

Don

I am looking to buy an Icom IC-R2. I have seen two different prices on the internet, $210 and $220, and like them both. What I'm looking for is a place to buy one. I can't find anywhere in my area to buy one. Is there any catalog/mail order places that I can find one and if so any links to there web site?

Thanks,
Matt

"C:\Program
>Files\MDT Monitor" by default.

Even double-clicking on the .exe itself from Windows Explorer gives me the
same result.

Hmm. A message posted to the newsgroup indicated 1.4.1 as being available.
The executable that I downloaded from the "Single File Setup" link was dated
1/10/99 when I downloaded it.

I'll try the 1.3 version and see what happens.

the northatlantic traffic. It would be helpful to identify the planes by
their SELCAL code. Does anyone know a SELCAL decoding software?

```
The SELCAL tones are, if I remember correctly, the Motorola A-series tones.
To identify a particular flight, you have to know what code was assigned to
it by ATC.
```

Today, Sunday, February 7, 1999, I downloaded both the "Single File Setup" and the "update" files from the MDT Monitor website. The update file contained the main executable dated 2/4/99. When run, the program refers to itself as "Version 1.3.0". The "Setup" file contained a .cab file that was created 1/30/99. Within that file is an executable dated 1/10/99 that calls itself "Version 1.1.1".

Looks like the "full" version needs to be recompiled.

The use both but you are most likely to hear something on the repeaters
which have much better range. Here are some NYSP freaks:

155.505 State Troop K
154.665 Stat Car-Car
154.920 State MobMon
154.695 Statewide
155.535 State Troop F
155.655 State Troop C
155.445 State Troop G
453.425 State TwyA
453.525 State TwyB

Can anyone tell me exactly what a frequency counter is and what is it used for? From what I heard about it, it sounds like some sort of spy device to point at something and find its frequency. Is that right?

thanks,
rd513@earthlink.net

642. San Jose PD renumbering their Channels?

Newsgroup: rec.radio.scanner
Date: 1999-02-07 00:00:00 UTC
From: "Robert H. Eisner" <rheisner@worldnet.att.net>
Message-ID: <36BDDEA4.4893@worldnet.att.net>
Source record: 128408
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Does anyone know if San Jose PD is planning on re-numbering their Channels? The current frequency for Channel 7 is 460.025, however, I've also heard this frequency referred to as Channel 10. I've heard several conversation in where they refer to Hanpac channels.

Does anyone have any additional info on this?

Bob

Corless Phone frequecies are not allocated by state. They're the
same across the USA and Canada.

Please note that it's ILLEGAL to monitor Cordless Phones in the USA.

The following List is for Informational purposes only!

==========

In the US and Canada they use the following:

PRE-1984 CORDLESS FREQUENCIES POST-1995 CORDLESS FREQUENCIES

Channel ## Rmte TX Base TX Channel ## Base TX Rmte TX
========== ======= ======= ========== ======= =======
Channel 01A 49.9300 01.6950 Channel 01 43.7200 48.7600

SELCAL tones aren't assigned by ATC. Each airplane has its own SELCAL and
it never changes. To page a particular Flight # the the Flight # must be
cross-referenced with the ship number making up that flight/leg.

Hi there,

I have that very nice and small scanner for about 2 years. There is a possibility to update this AX 400, so that there is now a clock, and some other new funktion.
This update also includes a new funktion called 'user'.

Does anyone know, what to do with the 'user' function in the menu.

so please answer here or, it would be very nice via email to tobins@gmx.net.

greetingz from germany

You know, I wonder if you know a thing about it. this is the most common way
of tapping a phone. The company will not do resistance checks unless they
suspect a problem in the first place

.
>The simple truth is that even relatively cheap and nasty telephone
>recording units used for bugging are all but impossible to detect
>electronically and a thorough physical search of the entire reticulation
>system must be carried out .

The TRUTH is that you don`t know what you are talking about ! Even "cheap
and nasty " taps have to have a means for getting the audio to it`s intended
destination, whether it be a wire or a transmitter. And even the "cheap and
nasty " ones EMIT RF ENERGY
>
>>There is, however, another kind of tap. This is called the "Infinity"

>meant to allow the spy to listen in to the phone conversations at all.
>It is a room bugging device which uses the telephone line as a
>transmission medium.
>
>An "infinity" transmitter, my greatly misinformed friend, can be used to do
EITHER ONE. I can either plant it in the room , and let it pick up the room
audio, or I can install it INSIDE your phone, if there is time and
opportunity. I would then use the clip leads attached to it to connect your
phone audio to it INSTEAD of using the mike in it. Wow, this is real
complicated, huh ? An "infinity" transnmitter is nothing more than a
transmitter and a mike, with a couple alligator clips attached to it to use
instead of the mike, if the opportunity presents itself.Don`t even bother to
argue further, since I own entire BOOKS on the subject of "bugs", and have
known about them for over 20 years !

664. Re: Pittsburgh, Pa. Freq.

Newsgroup: rec.radio.scanner
Date: 1999-02-07 00:00:00 UTC
From: Jack@sgi.net
Message-ID: <36BE4A95.6B37@sgi.net>
Source record: 128430

Doc, here goes without any special downloads (plug-ins):

Channel Service Freq. CTCSS
==
1 PS 1 453.10 186.2
2 PS 2 453.25 186.2
3 PS 3 453.400 186.2
4 PS 4 453.550 186.2
5 Fire 1 453.700 186.2
6 Fire 2 453.850 186.2
7 PS Tactical 453.450 186.2
8 PS Admin. 453.950 100.2
9 EMS 1 462.950 100.2
10. EMS 2 462.975 100.2
11. PEMA/Disaster 453.525 210.7 State EMA

There are 48 channels in public safety radios in PGH., I don't have the
time to type all of them. The above eleven are the primary frequencies.
I listed the CTCSS if you have a scanner with that option. In the PGH
frequencies you should not have any interference from other departments.

Barry:

CFR Title 47, section 90.69 has gone the route of the DoDo bird. This section has been replace in the re-farming docket as the Industrial/Business pool as CFR Title 47, section 90.35. These frequencies are most probably used by film production crews though, but are available to any applicant now. See FCC PR Docket No. 92-235. It was released as the Second Report and Order (FCC 97-61), Adopted February 20, 1997 and Released March 12, 1997. Available from the FCC web site in MS Word format.

To the original requestor, I would also try the itinerant and color dot frequencies.

VHF Itinerant = 151.625
VHF Itinerant = 451/456.8000, 464/469.5000 and 464/469.5500 MHz

670. John Mackey Ruined my Life!!! READ ON.....

Newsgroup: rec.radio.scanner
Date: 1999-02-07 00:00:00 UTC
From: Anonymous <nobody@replay.com>
Message-ID: <199902062306.AAA06053@replay.com>
Source record: 128456

Hello. I am posting this anonymously for fear of my life. Many of you think that picking on John Mackey and the others is just harmless fun. I did too until very recently.

I was on my way home from work last Thursday night when I noticed I was being followed. Curious to see who it was I puled into a nearby gas station and purchased a soda and some snacks, you know, just useless junk, but I wanted to see who else came into the store. Sure enough, two dudes in black suits walked in and looked right at me. They were all dressed up like the secret service or something - I don't know. These guys were serious about following me. I did notice something odd about them though. They were wearing sunglasses, but it was 7:30 at night. Anyway, that doesn't matter now. I'd better type fast, they might have this line tapped.

I continued pretending not to notice them although I couldn't stop snickering about the sunglasses thing. I kept wondering if they thought it was halloween. I go and pay for my snacks and head for the door, and as I walked back to my car my frequency counter started to
beep. I looked at the display and saw the frequency: 443.575 Mhz. That looks familiar, I thought, but then I looked at my car and realized I had left the window down. I had been bugged!

Just then I turned to look back at the FBI looking guys and they were walking towards me! I heard one of them whisper to the other "I think he's onto us" and the other just nodded, reaching into his jacket.

Needless to say I didn't stick around long enough to see what they were going to do next. I took off running, and they gave chase. They were yelling "federal agents! stop!" but I didn't know if they were real feds or not. My mind raced as I ran to think what they might want with me. Could it be my cellular scanners? Unpaid parking fines? Overdue library books?

I finally lost them a few blocks from the store, but I was still several miles from home. I couldn't go there anyway, they'd surely be waiting for me. Unless these guys were just muggers trying to trick me. So, I decided to call home. Sure enough, my wife answers. I say hello and she says "hello sweetie. When are you coming home? I made your favorite, meatloaf" which is our codeword that means the feds are there. I said "Not for a while yet, going bowling with the guys tonight. I'll call later" which means get the f--k out of there and meet me at "our prearranged location". For obvious reasons, I'm not posting the actual location here hoping that my wife can escape from custody and meet me there.

Then it hit me where I saw that frequency before. Take a look at http://www.parg.org/News/ Frantically I searched the ham bands on my scanner. This is what I heard:

"N7QOR to KA0SSF. John, you there?"

"KA0SSF to N7QOR. Yeah Nick. I'm here."

"So, do you think we made our point?"

"Yeah, we've got him running scared now. It's only a matter of time."

"Too bad he spotted those feds after they planted the bug. That'd could have made for some interesting listening."

"So what should we do to the others?"

"Same thing we're doing to [my name was mentioned here]"

"HA HA HA HA HA. Yeah, I like the sound of that. That'll teach them to mess with [A local amateur radio club's name was mentioned here]"

I found an abandoned car to sleep in and then met my wife at our meeting place with tickets out of the country. But let me tell you, these guys are good and they don't f--k around, OK?

We took seperate cabs to the airport, and the place was crawling with cops. I couldn't figure out what the hell was going on, but my wife and I were pounced on as we exited our cabs. We were taken to an interrogation room and there on the table was printouts from the newsgroup. Some were actually mine, but someone else logged in as me and posted a whole bunch of cancels on the sex newsgroups and then flamed the hell out of some addicts on the sex addicts groups. Then they put up a kiddie porn site and listed me as the contact point. I tried to explain that I was framed but then they pulled out box after box of disgusting porn tapes and asked me to explain how those tapes got into my house. I said I never saw them
before, they couldn't have come from my house, but they insisted that they did, and I was looking at serious jail time. I did nothing wrong, yet these f--king cops had already raided my home, frozen my assets and towed away my car. Then they included using my scanner to aid in the commission of a felony to the long long list of charges.

I was in some seriously deep shit. Framed by Mackey and his pals. Those assholes... I was ready for blood. I yelled "Look out" and the cops turned to look and I split. Good thing I keep a handcuff key in my sock! They never knew what hit them and despite the surveillance cameras and cops everywhere I made my escape.

I am now living on the run, and I have no idea what became of my poor innocent wife - all because I wanted to have some "harmless fun" on the internet. Rest assured though, when this is all through I will have my revenge on those bastards. They haven't seen the last of me!

To everyone out there who likes to flame Mackey: Smalley, allsafe, Cheek and the others, stop now, before it's too f--king late. Don't end up like me, please. Take this as a stern warning from an anonymous friend and ally, YOU DON'T WANT TO F--K WITH JOHN MACKEY!!!!

Howdy,

Can anyone tell me if there is a program equivilant to tracker that is in a windows 95 format. I have a 2 level fsk interface which is working fine with mdt but would like a program more 'user friendly' than a dos based one.

Also if anyone could tell me what data format messages are sent by with any taxi companies or metro fire service in South Australia. I know the taxis use Raywood systems but I have checked their web page and it has no mention of what system they use.

Any info would be much appreciated....

Thanks,
Richard

> 1.1.1.

Are you clicking on MDTMon.exe from Windows Explorer or on a shortcut? If you're clicking on a shortcut make sure it's pointing to the MDTMon.exe file in the directory you installed to. The installation directory is "C:\Program Files\MDT Monitor" by default.

Also, you might try using the find utility to make sure you only have one MDTMon.exe on your system.

The latest version is 1.3.0... You might want to try redownloading the update file and unzipping it into your MDT Monitor directory... it contains the exe, a dll, and a device driver file... Your MDTMon.exe should be dated 2/4/99 if you have the latest version.

I've tried locating this information via various WEB searched to no avail...

Anyone know where I might find the police codes for Chelmsford, MA?

Is there a "clearinghouse" for this kind of info on the WEB that I missed?

I *did* find codes for agencies here and there, but not what I wanted.

Keith,

This time of year you`ll only need these four freqs.

* Ch 13 Freq. 156.650mhz Barge & Lockmaster (most active for this
time of year)
Ch 16 Freq. 156.800 Calling channel (kind of like cb ch 19)
Ch 68 Freq. 156.425 chit-chat
Ch 69 Freq. 156.475 chit-chat

Channels 13 & 16 are busy all year round with barge & brige traffic while
68 & 69 are used mostly by pleasure boats needing fuel & alcohol or party
times.

Happy Scanning,
Charlie

701. FS:Pro-2004 and BC950XLT

Newsgroup: rec.radio.scanner
Date: 1999-02-08 00:00:00 UTC
From: Ben Saladino <bicycles@fastlane.net>
Message-ID: <2F38ECFB01D11F7E.67EB80B1DCFB4C03.ABFF8B3A1A5F09EE@library-proxy.airnews.net>
Source record: 128237

For Sale: Uniden Bearcat BC950XLT Radio Scanner
Mobile/Base Scanning Radio
100 Channels in 5 Banks
Great small size for vehicle mounting
Preprogrammed Search Banks for Police, Fire, Aviation, Weather, and Marine
Cool Orange Backlit LCD
Great Audio
Coverage:
29.0-54.0
118.0-174.0
406.0-512.0
806.0-956.0
AM/FMN
CTCSS Tone Board Option capable, but not included
In Good Shape with manual
$125.00 includes shipping in the continental US by UPS COD Certified Check
or Money Order.

****

For sale: Radio Shack Pro-2004 Radio Scanner
Desktop/Base
400 Channels in 10 banks (originally 300)
10 Search Banks
10 Monitor Channels
Attenuator Switch
Tape Jack
External Speaker Jack
Headphone Jack
Lock Out Review
Coverage:
25.0-520.0 Mhz
760.0-1300.0Mhz (Full-Coverage-Cellular/clipped diode)
AM, FMN, FMW
Great for Military Aviation, TV Audio & Broadcast Radio
This was one of the greatest scanners ever made, and has seen a lot of use,
but still works. The back light is out, and I think it is causing a quiet
hum that is noticeable if there's not much other noise in the room. There
are lots of mods and experiments available for this radio. I believe this
one has already had the speed mod. I have 2 more of these in addition to a
lot of other scanners, and just don't need this one anymore.
In box with manual
$150.00 includes shipping in the continental US by UPS COD Certified Check
or Money Order.

Oh yeah. You're going to burn in hell. But since you're going
anyways.....

Did'ja know that the Pro-39 is modifiable? I've got one of those dual
conversion sweethearts and wouldn't part with it for anything. It's not
quite as good as the Pro-43, but it's a real winner in its class.

Now, I've heard that some of the Pro-39's had some anti-tampering
measures added late in the production run....But I've never seen one.
The rumour may have started because of confusion with the Pro-43
production run (which *did* have some anti-tampering measures on models
produced after April of 1994).

But I bought one, the mod worked as advertised, a cohort of mine also
bought one and performed the mod and it worked just as well.

(it wasn't a "cell" mod mind you, that would be *illegal*. The mod I
did....uh...er......adjusted the...uh.....adjusted the backlight. Yeah.
That's it. It adjusted the backlight.)

Yeah.

That's the ticket.

You frigg......OOOPS!, wrong post.

rd513,

A frequency counter tells you the frequency of a transmitter if you are close enough to it. Lets just say that you found a walkie talkie at a garage sale & it has a switch for ch1 & ch2. Without knowing the frequency of this radio, you could use a frequency counter. All you would have to do is turn on both the radio & freq. counter & key the mic. BINGO, you now have the frequency of the walkie talkie on the screen of the freq. counter. Next, program the read-out from the freq counter into a scanner & you now can listen to yourself.

Hope this helps,
Charlie

It prevents allegations of rape. When a male officer has a female in custody, he announces 101 in custody, mileage (odometer reading) xxxxxxx.x when he arrives at the station/jail, or where ever the final destination is, he again announces mileage. If the female in custody makes an allegation against the officer, they retrace his rout to see if the mileage matches. Over time, 101 has evolved to refer to any female, whether in custody or not.

Airline policies vary. At Delta we will let you use a scanner after takeof and prior to descending through 10000' Personally, I've never been the slightest bit concerned about what a pax may hear me say on the radio. The info is in the quick reference card at each seat position and also we have it in greater detail in our FOM (Flight Ops Manual).

People have unreasonable expectations about what will happen if our flight instruments are interfered with. Generally, nothing. In the worst case, maybe a go-around or query from ATC as to where we are going. We're not going to roll the thing inverted and pull.

>Hello everyone,
>I am taking a trip soon and was wondering
>if I can take my BC80 on the plane to
>monitor stuff with?

Most airlines allow the use of a scanner onboard except during takeoff and landing. Check the back of the inflight magazine for the rules on the airline you're flying. Most publish guidelines for the use of electronic equipment (computers, scanners, etc) in the information pages at the back of the magazine.

Don't rely upon what you are told by a flight attendent - they are often wrong.

If you are told to turn the scanner off, do so. Failure could result in federal prosecution for interfering with a flight crew. However, once you comply and turn the radio off you can ask to speak to the head flight attendant on board, and ask her/him to get a ruling from the captain. Knowing the rules as they are laid out in the in-flight magazine will help you plead your case.

For that frequency range I would recommend a all band discone antenna,
Radio shack has a fairly good one. before installing it though make sure
you have lightning protection just in case. Use heavy cable (HELIAX) if
possible as the loss of signal at 800 is quite substantial.

Hammond is active on the Trunked system. The 821-823 freqs are the mobile
inputs to the repeaters, and you would only hear them if you were close by
the mobile or portable.

725. Re: ? on the New York State Police.

Newsgroup: rec.radio.scanner
Date: 1999-02-08 00:00:00 UTC
From: Al Robinson <robinsona@rl.af.mil>
Message-ID: <36BF2364.C1654230@rl.af.mil>
Source record: 128299

They use simplex. 155.505 Base to Car, 154.92 Car to Base. There is also a car to car frequency that I don't remember offhand. On the New York State Thruway, the State Police use 453.425 and 453.525 for repeaters.

If the flight crew allows you to operate an electronic device then it is permissible. The FAA rules leave it up to the operator of the aircraft to decide whether a device will be allowed. If the airline does not specificly prohibit it, the captain may do so.

It has been my experience that the crews will usually allow the operation of a scanner with earphones except during takeoff and landings. They usually use the same rules that apply towards computers and personal CD players.

There has never been a documented crash due to a passenger using a scanner or other electronic device.

The CDPD protocol certianly does use the cellular infrastructure as a
carrier for the data. The Illinois State Police just announced they would
be using this protocol for their activities, and many of the local
agencies will surely follow. The Illinois ALERTS group also offers CDPD
as a method, along with RD-Lap and (to be phased out) MDC4800.

The initials CDPD stand for something like "Cellular Data Protocol
Design", and is marketed towards commercial and public safety uses.

As far as I know there has yet to be a method of real-time decoding of
CDPD, as there is currently available for 4800 and soon for RD-Lap. I am
sure that there will be soon. I remember a year ago advising the people
who work with me that thier conversations on the MDT's could not be read
real time, but that has changed. It is only a matter of time and effort.

With the recent advances of trunk tracking by several companies, the MDT
programs that are freely available on the Internet, and other rapidly
advancing technologies, this is an exciting time in the scanning hobby.

I have a RS PRO 39 and ICOM A21 aviation transceiver. On both scanners I hear spurious emissions from my vehicle engine on the air freqs. I drive a Chrysler van conversion with a TV and video player. It must have something to do with the TV as these emissions don't occur in other cars. Is there anything I can do to correct the problem.
This doesn't happen on my RS PRO-91. Thanks for any help. Oscar

Chances are they're hearing an image of Cellular phones. Most of
the 900 Mhz cordless phones are allocated in the 902 - 905 Mhz and
925 - 928 Mhz range of the ISM band (which runs from 902 - 928)

I suppose you get alot of threats Tim, given your track record of infuriating
everyone you encounter, it's not hard to believe. But I've heard this .wav file,
and there was nobody threatening you. Even if there were, does that give you
the right to conspire to have him killed? I think not.

> I made a statement to Sid that "he

As I have posted before, there is a finalization process taking place to put a phase-arrayed satellite antenna on the top of the fuselage of commercial passenger aircraft for satellite modem accessibility to the internet for the passengers in every seat. The University of Michigan, here, was a consultant to this program. Obviously, the airline industry doesn't consider hooking your laptop up to the internet at 30,000 ft. as putting the flight controls in jeopardy.

I too picked up the DJX10 used off the net. Good radio! At least
for portable use. I found the supplied antenna not to be very good and I
substituted a MFJ 1714 2 meter 5/8 wave. It is extendable and works well
for most of the receiver's range and works well on the HF frequencies,
works really well on the VHF high band. The price is about 16 dollars
from AES.
More on this later..... 73 Rod

As far as I know, you cannot TRANSMIT from a plane without the pilot's permission. As for receiving, I don't know, but I would guess that they wouldn't like it. Imagine this scenario: Something minor goes wrong in the cockpit, nothing to cause the plane to crash, but important enough so the pilot has to call the tower and report it. Now, is a pilot going to like the idea that someone in the cabin of his plane might intercept that transmission (most scanners allow monitoring of the aircraft band) and then misunderstand it, possibly causing panic among the passengers? Just a hypothesis...

I have also found VTech phones to be virtually garbage. They tend to last about a month (longer if you regularly throw them across the room). There are DSS 900MHz phones out there; I don't know about your Panasonic, but I've noticed that Radio Shack clearly states which of their phones are analog, digital, and DSS. I could care less about all that, as long as they are voice-scrambled, but I do like the fact that most (all??) of RS cordless phones have plastic buttons instead of latex or rubber ones. But that's just a personal preference. You should have a Questions/Comments number in the manual to your book; see if you can wring any info out of them that way. Good luck!

It is also possible that it is a ham transmission. Hams have access to the 902 to 928 Mhz band also. There are some repeaters in this band and also some narrow-band simplex links.

You can probably get the 2006 at any web site selling
scanners. However if you live in the United States
then some International scanner retailers may not want
to do business with you because of the federal laws
prohibit the importing to cellular modified scanners.
If you can find a dealer that will sell a 2006 to you
and it is cellular modified the scanner will siezed by
US customs.

I have both radios. If I could only pick one, I would take the Yupi anyday. It has more channels, better sensativity, clearer and louder audio, and better frequency coverage (including shortwave bands) than the Pro-26. The main advantages for the 26 are faster scan and search speeds and perhaps better intermod rejection and resistance to overloading. Both radios, like most sensitive handhelds, easily become overloaded in urban environments with paging and cell phone towers within shouting distance. Both radios have an attenuator, which I is useful occasionally for the situations above. Both radios are good scanners, but I find the Yupi far better, primarily due to the audio, sensativity, channels, and freq coverage.

Murray,
It sounds like your decoder is using your dsr pin instead of
your cts. Trunker looks for data on the cts pin and not the dsr. I belive
you can set your trunker environment file to read off of your dsr pin.
You'll have to try it out and see if it works for you. If not check your
decoder wiring I've built 4 decoders and all of them use the cts pin for
data.
I hope this helps,
Bret

Well I've worked for both the military AND a telephone
company and I've never heard of a stupider way then
hardwiring into an existing phone line.

All you need is an INDUCTIVE tap to monitor and line.
It's the same method us phone company technicians use
on our test or "bubinsky" phones. It's also harder to
detect since it doesn't cause severe line-loss or
increase the resistance on the line much.

You can probably find an inductive amplifier at a swap
meet or maybe even Radio Shack. The hard part is
isolating the correct line and finding someplace
descreet to attach the equipment. By the way, that's
what inductive amplifiers or "bananas" as techs call
them are used for mainly. You place a tone generator
on the phone jack and then trace it in the
cross-connect or terminal room to find out which pair
it is. The banana doesn't even have to touch the wire
to pick up the generated signal. That's why it's
called an "inductive" amplifier. The same device will
pick-up conversations.

From: Mike Dockery <mdockery@koral.com>
Message-ID: <36bf1064@news3.us.ibm.net>
Source record: 128376

Greg is correct, I fly 747's and when we check on with oceanic control we give them our selcal ident which is a 4 digit alpha code (ABCD) and they send us a test tone to make sure it's working okay, then when over open ocean or land in a non-radar environment we don't have to monitor the HF radio constantly so if ATC has a message or change in our flight plan they can sent us the selcal and we get a visual and audio alert and then we call them back. Each time we change to a new controlling agency we give them our selcal code and request a test.

783. Any Canadians here sell a cellular scanner to an American? What about US Customs??

Newsgroup: rec.radio.scanner
Date: 1999-02-08 00:00:00 UTC
From: brad_lee@my-dejanews.com
Message-ID: <79nedrfpo1@nnrp1.dejanews.com>
Source record: 128379

Since they are illegal in the US, how do you sent it?

Does customs open the package?

I actually live 5 min from the US border so would it be more difficult to physically bring it across? (i.e. would US Customs definately want to see the item?)

Does US customs charge for bringing it across?

I have asked the US people general questions but they just told me "when you sell something, bring it in and we'll take care of it" very vague and sort of scary too... I picture getting arrested and being banned from entering the US if I ask too many questions. They always seem to be in a bad mood.

If I sell more than one will they think I run a business and give me a rough time?

If I mail it from Canada, I wonder if it would be easier than mailing it from the States??

784. Re: Any problems ordering from Cooper Electronics ?

Newsgroup: rec.radio.scanner
Date: 1999-02-08 00:00:00 UTC
From: Theodore Andrew Brown III <AngryPeter@MediaOne.net>
Message-ID: <36BEDB64.E782E88C@MediaOne.net>
Source record: 128380
Cross-posted to: rec.radio.cb,alt.radio.scanner,rec.radio.scanner

Last year I ordered and prepaid for TWO RCI-2980 with TWO Knight K
Eagles.
When I received the radios I took them to a local radio shop for
modifications.
Whiles stand beside the Tech, he said this one radio was already
modified.
I would never have believed him if I wasnt RIGHT there when he opened the
box.
He checked out the radio and said I should return it.
I called Copper, and after 2 months of play their little phone games,
with those
F*CKING C*NTS answering the phones. I learned the vice president Paul is
actually the SOLE OWNER of copper electronics. I called the sec. of state
for licensing corporations and business in Ky. and learned alot of info
about copper and the numerous 4,000 plus complaints registered with
consumer protection.
I searched my phone listing CD for the owner, I called him at home on
Saturday afternoon, I explained what happened and he said "I opened the
cover and voided the warranty" "I will do nothing for you" and hung up on
me!
One of these radios was a birthday present for my handicapped father so
we could stay in touch.

The only thing nice I can say about copper electronics was the order
arrived on time!

Apparently this city has gone to a 800mhz trunked system. Channels
range from 866.075 to 868.1875. The FCC database
also lists licenses from 821-823 with the same endings as those
frequencies in the 866-868 range. Is there a special trick
to listening to these systems? There is absolutely no activity on these
channels. This is a very busy police department, however they've
disappeared off my scanner. If there is anything I'm missing I would
appreciate any suggestions. Thank
you.

Dave

Source record: 128384

So here comes our friend Casey Thrower, going by the handle of "TWB" or whatever he decides to use today (the poor little meathead still hasn't realized that we recognize his posting host and dialup ID, even though he keeps changing his username that appears in the headers.) He makes this big speech about how "everything was quiet for awhile", until now. That big 'ol, bad 'ol CB Rambo has resurfaced on the newsgroup. Well guess what, Thrower...if you and/or your friends hadn't decided to get on here and impersonate me from DejaNews, you wouldn't have to worry about it. You remember the old story about letting sleeping dogs lie...
But you couldn't leave well enough alone, could you? Either you or one of your buddies.

So now I'm back...and for a long time to come. Deal with it. Either that, or turn your computer off and go play with your plastic submarines in the bathtub. That seems to be what you do best. You lose again, Thrower.

"Where's that big 'ol CB RAMBO??"
"I wanna hear him TALK TOUGH!!"

Say several cars are dispatched to a crime in progress call. The first car on the scene says it can't find the trouble, or the problem is very minor, so he would say "Take a slowdown" the other cars would do just that, slowdown. Squads would still go to the call, but at a normal speed. I have seen cars going to a "hot" call, only to collide at an intersection on the way to the call...
home I explained this OK...

"Take a Slowdown" means just what it says. When a second unit is
responding as a backup, the original officer will tell him to "Take a slow
down" if conditions do not warrant a rapid response. The followup officer
will still respond, but will wait for the lights and stop at stopsigns
etc.

Another similar term heard: "Take a Waveoff" (Don't bother coming at all,
I'm OK)

It has nothing to do with doughnuts or coffe breaks.....

Question for "Proudhawk"...why is it that whenever someone mentions Eric Oyen, you immediately JUMP on the post and add your comments? You make very few posts overall, but yet you're ALWAYS there with your two cents' worth whenever the name Eric Oyen is mentioned. Of course, if anyone should suggest that you might in fact BE Eric Oyen, masquerading under the "Proudhawk" screenname, you jump up and down with denial, insisting that Eric is simplyh "a neighbor of yours" and that you two most definitely are NOT one in the same.

Sure is a coincidence, isn't it, OYE...I, I mean "Proudhawk."

"Where's that big 'ol CB RAMBO??"
"I wanna hear him TALK TOUGH!!"

I am sure that everybody reading this knows that VHF and UHF radio signals can only be received if the receiver is within "line-of-sight" from the transmitter (except for unusual propagation conditions such as "skip").

Therefore you may be surprised to hear that I receive VHF and UHF signals from over 3000 km (yes that's THREE THOUSAND kilometers) away every single day. And yes, the reception is still line-of-sight.

The secret is that the transmitters are located in Earth orbit, on board satellites. Monitoring radio signals from satellites is a fascinating hobby which can be taken up by anybody owning the cheapest Radio Shack scanner. I have received Slow-Scan TV pictures from Mir; heard crews on board Mir and the Shuttle talking, and I have decoded data signals from some of the satellites that I listen to.

If this subject interests you too, please visit the "HearSat" website at:
www.geocities.com/CapeCanaveral/Launchpad/1530

If you are a Networld user, the Networld for this site is simply:

>save the cost of two seperate scanners...
>

It can work, depending on the type of system you're listening to. A motorola system, like the ones that the trunktracker scanners follow, is the easiest to use for this type of application.

The program simply has to listen to the data channel, wait for an ID to come up that you have selected to listen to, switch to the frequency assigned to it, then as soon as the carrier drops, the scanner switches back to the control channel and the cycle repeats.

On the GE/Ericsson systems, there's a catch: The program would have to listen for the anti-scanner beeps to know when to switch. I've toyed with the idea of a soundcard EDACS decoder for the 895xlt, but I haven't written one yet. I just know it's possible, and quite feasible as well. But, I have too many side projects going now as it is. Maybe after I finish what I'm working on now, I'll play with it. If someone else would like to try it in the meantime, I can certainly get you pointed in the right direction...

-Phil

For what its worth, Radio Shack's Speaker Mic for the HTX-202, appears to work well with the IC-T8.

There is a Yaesu adapter sold by Amateur Electronics Supply, to convert the antenna connector to BNC. Unfortunately, it is expensive.

813. HR 514 - The text of the bill

Newsgroup: rec.radio.scanner
Date: 1999-02-09 00:00:00 UTC
From: jtward01@aol.com.nospam
Message-ID: <19990209140427.17230.00000395@ng155.aol.com>
Source record: 128197

Be it enacted by the Senate and House of Representatives of the United
States of America in Congress assembled,

SECTION 1. SHORT TITLE.
This Act may be cited as the `Wireless Privacy Enhancement Act of 1999'.

SEC. 2. COMMERCE IN ELECTRONIC EAVESDROPPING DEVICES.
(a) PROHIBITION ON MODIFICATION- Section 302(b) of the Communications Act of
1934
(47.S.C. 302a(b)) is amended by inserting before the period at the end thereof
the following: `, or
modify any such device, equipment, or system in any manner that causes such
device,
equipment, or system to fail to comply with such regulations'.
(b) PROHIBITION ON COMMERCE IN SCANNING RECEIVERS- Section 302(d) of such
Act (47 U.S.C. 302a(d)) is amended to read as follows:
`(d) EQUIPMENT AUTHORIZATION REGULATIONS-
`(1) PRIVACY PROTECTIONS REQUIRED- The Commission shall prescribe regulations,
and
review and revise such regulations as necessary in response to subsequent
changes in
technology or behavior, denying equipment authorization (under part 15 of title
47, Code of
Federal Regulations, or any other part of that title) for any scanning receiver
that is capable of--
`(A) receiving transmissions in the frequencies that are allocated to the
domestic cellular radio
telecommunications service or the personal communications service;
`(B) readily being altered to receive transmissions in such frequencies;
`(C) being equipped with decoders that--
`(i) convert digital domestic cellular radio telecommunications service,
personal
communications service, or protected specialized mobile radio service
transmissions to
analog voice audio; or
`(ii) convert protected paging service transmissions to alphanumeric text;
or
`(D) being equipped with devices that otherwise decode encrypted radio
transmissions for the
purposes of unauthorized interception.
`(2) PRIVACY PROTECTIONS FOR SHARED FREQUENCIES- The Commission shall, with
respect to scanning receivers capable of receiving transmissions in frequencies
that are used by
commercial mobile services and that are shared by public safety users, examine
methods, and

may prescribe such regulations as may be necessary, to enhance the privacy of users of such
frequencies.
`(3) TAMPERING PREVENTION- In prescribing regulations pursuant to paragraph (1), the
Commission shall consider defining `capable of readily being altered' to require scanning
receivers to be manufactured in a manner that effectively precludes alteration of equipment
features and functions as necessary to prevent commerce in devices that may be used unlawfully
to intercept or divulge radio communication.
`(4) WARNING LABELS- In prescribing regulations under paragraph (1), the Commission shall
consider requiring labels on scanning receivers warning of the prohibitions in Federal law on
intentionally intercepting or divulging radio communications.
`(5) DEFINITIONS- As used in this subsection, the term `protected' means secured by an
electronic method that is not published or disclosed except to authorized users, as further
defined by Commission regulation.'.
(c) IMPLEMENTING REGULATIONS- Within 90 days after the date of enactment of this Act, the
Federal Communications Commission shall prescribe amendments to its regulations for the
purposes of implementing the amendments made by this section.

SEC. 3. UNAUTHORIZED INTERCEPTION OR PUBLICATION OF COMMUNICATIONS.
Section 705 of the Communications Act of 1934 (47 U.S.C. 605) is amended--
(1) in the heading of such section, by inserting `interception or' after `unauthorized';
(2) in the first sentence of subsection (a), by striking `Except as authorized by chapter 119, title
18, United States Code, no person' and inserting `No person';
(3) in the second sentence of subsection (a)--
(A) by inserting `intentionally' before `intercept'; and
(B) by striking `and divulge' and inserting `or divulge';
(4) by striking the last sentence of subsection (a) and inserting the following: `Nothing in this
subsection prohibits an interception or disclosure of a communication as authorized by chapter
119 of title 18, United States Code.';
(5) in subsection (e)(1)--
(A) by striking `fined not more than $2,000 or'; and
(B) by inserting `or fined under title 18, United States Code,' after `6 months,'; and
(6) in subsection (e)(3), by striking `any violation' and inserting `any receipt, interception,
divulgence, publication, or utilization of any communication in violation';

(7) in subsection (e)(4), by striking `any other activity prohibited by subsection (a)' and inserting
`any receipt, interception, divulgence, publication, or utilization of any communication in violation
of subsection (a)'; and (8) by adding at the end of subsection (e) the following new paragraph:
`(7) Notwithstanding any other investigative or enforcement activities of any other Federal
agency, the Commission shall investigate alleged violations of this section and may proceed to
initiate action under section 503 of this Act to impose forfeiture penalties with respect to such
violation upon conclusion of the Commission's investigation.'

I hope that the bill is written to obviously make clear "cellular phone digital phone, and PCS phone communications." Notice the word "phone" in each object. If it is written this way, we will still be free to intercept digital and analog RADIO communications.

Sounds to me like they are trying to weasel in a way to kill digital scanners. An interesting note that simply shows the ignorance of our elected officials is the fact that there is no legislation against decoding these technologies using the discriminator audio fed into a computer that does the decoding. Think about it: one could legally write a DES decoder program and market it because it ISN'T a radio. It would be technically illegal to use, but not to sell..... hmmmmmmm......;-)

An act of our Congress required the FCC to regulate scanners and require that they cannot receive frequencies used by cellular telephonse and some other services. Modifying the scanner to defeat the system that locks out these frequencies is also illegal. Our Congress was not willing (possibly because of pressure from the NSA) to tell the industry to use encryption to keep conversations private, so we have scanners with certain frequencies blocked.

>verified this by monitoring repeaters at the time this interference occurs.

I use my Cobra MicroTalk 3's primarily at the ski lodge-ski slope areas. We were normally on Channel 10 when we started hearing busy traffic from what sounded like an area gravel company. So we reset our MicroTalks to Channel 8 with a CTSS. We haven't heard any traffic on Channel 8 since switching.

Warning about Channel 1 : Every kid at the ski areas whose parents gave them FRS's uses Channel 1 !!! It has become the most congested channel on FRS; therefore, as FRS becomes busier, don't expect us to just use Channel 1-7 so we don't interfere with your GMRS, because I'm telling you, FRS is going to get even more crowded, soon.

Im 99.9 % sure I'm hearing 112 Taxi (Patchogue)
on an Image on my BC-895...

The problem is I don't Know their Transmitting Freq, I hear
them on 823.375 (but its an Image...)

Can ANYONE find the Freq for them.. Its on 800 or 900 mhz...

I saw the Antenna on their Taxi.... They are using NOT a
Trunked System...

Thanks
Keith

From: Phil Smalley <ziggy7445@yahoo.com>
Message-ID: <79q7q9$js4$1@phxtst22.phx1.aro.allied.com>
Source record: 128213

Obviously, theft of cellular service is a big problem, since that is the *excuse* being used by the government to go after cell-capable scanners. After all if one can listen in on the conversation, one could also snatch the ESN and clone a phone.

What our congresscritters don't realize, and what the cellular industry isn't telling them, is that it is far easier and more practical to use a modified CELL PHONE to do this rather than a scanner. I have seen web pages that go into full detail on how to modify an old cell phone to pull ESN's and it's far less complicated than building a dataslicer.

A quick search on Yahoo, Dejanews or Altavista will most likely list sites that detail how to modify a cell phone to connect it to a PC and use a readily available freeware program to pull the ESN's. From there, you simply take the phone you want to use and reprogram it with that information and presto! Free cell phone calls. The interface also lets you follow any calls you receive. Try doing that with a scanner sometime...

Someone should write to congress and let them in on this little secret, since I'm sure the cellular industry isn't going to. Maybe then they'll leave scanning alone and concentrate on the real culprit. (yeah right...)

-Phil

I have looked every where and have not found any other mods for this scanner. Trust me I have looked everywhere! How did you do the mod? Did you adda switch and if so where did you place it? I have done the mod but insteed of using a switch, I just connected the two ends of the wire so the backlight is always on.

Here is just one example, it took me about 5 seconds to find this with
Altavista:
http://www.thedigital.com/phreaking.html

I'm sure there are literally hundreds of sites like this, yet the FCC has
done nothing to force the cellular industry to make their equipment more
secure.

Food for thought....

Check the pin in the middle of the BNC connector on the antenna. The rubber duckies packed with the 235's are notorious for that pin coming loose. It usually then stays in the radio end, but then the connection between radio & antenna is "iffy" at best.

Once that pin comes out of the antenna I don't think it can be fixed. Don't know if Uniden ever made good on this problem or not. I worked at a scanner dealer and we had to replace LOTS of the 235 antennas...see if you have any other old antenna laying around and I bet it brings the thing back to life.

DHL, FEDEX and UPS will all handle in bound customs and send you a
bill. They have employees who fill out the import documents, get US
customs to stamp them, pay the duties, and get on with it.

However my experience is they rarely get it right. There is an HTS
number that determines the duty that should be paid, and invariably
the people working for the courier companies don't know enough to
properly classify the goods It isn't a trivial exercise, and often
cannot be accurately discerned from the custom declaration with the
goods. (you would be amazed at how many categories there are for
something like a disk drive).

For $10 however it rarely pays to argue. By the same token, these
guys know so little about anything outside the ordinary that they are
likely to put the goods into a class where customs wouldn't even think
about whether or not it was legal in the USA.

If you ship via Air parcel Post, and especially small packet Air Mail
(useful only for up to 4 pounds), odds on customs even looking at it,
or paying duty are small, and on small packet, just about zero. since
small packet cannot be insured, the thinking by customs is that it if
you cannot insure it, cannot be worth much, so they don't bother to
even look at the declaration!

Congress should stop fucking with anything between 1Hz-2Ghz and let us listen wide
open.
I'm sick of this "missing chunk of frequency" shit in just the USA while all other
countries (Except
France (Which doesn't matter anyhow)) have wide open frequency.
If Cell phones have a problem then let them have their privacy somewhere in the 4Ghz range.
:)
Oh yeah, BTW, those damned cell phone people need to give us back our area codes and stop
driving so
damned slow on the highway too.

Hello all.
I hear rumours that Uniden is going to start sell scanners that can decode
Ericssons EDACS-system, can someone verify that?

And does anyone know the difference between EDACS and TETRA (Public Safety
Digital Radio System for Europe).
Is TETRA more advanced and more difficult to decode?

Thanks
Oden

Was it localised or apparent wherever you drove? Maybe it was a digital
cordless telephone?

Tetra is a whole new ballgame but there are hints of the beginnings of some decoding software - fast processor and Windows NT4 only, so far. Have a look at www.geocities.com/CapeCanaveral/Hangar/8539/04DATA.HTM

856. Re: channels 1-7 Vs. channels 8-14.

Newsgroup: rec.radio.scanner
Date: 1999-02-09 00:00:00 UTC
From: ke6zgp@aol.com
Message-ID: <19990208200323.10510.00000252@ng-ce1.aol.com>
Source record: 128252

Actually IT IS recommended to stay off of channels 8-14 because of the possibility of interfering with GMRS repeaters. Channels 1-7 operate at 462MHz (the repeater output freq) while channels 8-14 operate at 467MHz (the repeater input freq) with or without a CTCSS tone the chances of interference by a FRS unit are still great even at a 1/3 or 1/2 watt. This was proven with my IC-Q7a, I was able to activate our local CAP repeater from my house 20 miles away even with a stubby duck at the 1/3 watt. If this is possible with a CAP system it is possible any other time with any other system including GMRS with any radio programmed for that system.

Source record: 128257

OK... someday the cellular analog spectrum (826-845 & 869-894 MHz, close enough for govt work) will no longer contain the conversations that are now heard. Scanners currently blocked in this range will still be blocked. BUT.... who will get that frequency spectrum next ??? Think about it. Will it be digital or analog. If analog those new "blocked" scanners will still be deaf to that range. Reallocation of the spectrum could pose a problem to those of you who have those "now legal" (blocked) receivers.
Just a thought.....

Source record: 128274

For Immediate Release
February 4, 1999

WILSON SPONSORS BILL TO KEEP CELL PHONES PRIVATE

ALBUQUERQUE -- Congresswoman Heather Wilson yesterday introduced and spoke on behalf of legislation to keep cellular phone conversations private. The Wireless Privacy Enhancement Act, HR 514, prevents purposeful eavesdropping on private cellular calls by scanners that have been illegally modified. Wilson spoke on behalf of the bill during a hearing on the bill in the Telecommunications, Trade and Consumer Protection Subcommittee.

"Over 60 million Americans have cellular or digital phones. People expect those calls to be private, but modification of scanners to listen in on conversations and eavesdropping is not clearly prohibited by law," Wilson said.

The majority of cellular services used today use analog technology. Analog communications are susceptible to unauthorized eavesdropping from scanners since voice transmissions need not be decoded by a scanner. Digital cellular communications are less susceptible to unauthorized eavesdropping than analog, but modifications can be made to scanners to invade the privacy of digital phone callers as well.

Currently it is against the law to intercept and divulge radio communications including cellular calls. This prohibition does not extend to digital calls or personal communications services. It is currently legal under existing statutes to intercept radio communications as long as the content of the communication is not divulged or does not "benefit" the interceptor.

"Some people choose to listen to police band and emergency service radio transmissions," Wilson said. "This law will not affect them. It will however affect those people who illegally modify scanners to listen in on private conversations of cellular phones. This is a critical civil liberty issue that needs to be resolved in this Congress."

The bill will make it illegal to intentionally intercept private cellular, digital or PCS communications. It will make it illegal to divulge the content of these communications if they are unintentionally intercepted. The bill prohibits the manufacture of scanners to intercept these calls and directs the Federal Communications Commission to prepare regulations to deny the authorization of equipment for certain scanning receivers that may be easily modified to intercept transmissions. Furthermore the FCC would be required to investigate violations of the

law and to enforce through forfeiture penalties.

PL, stands for Private Line, a Motorola name for CTCSS

CTCSS stands for Continuous Tone Coded Squelch System. It's a system
in which a subaudible tone is broadcast along with the voice carrier,
which opens up the receivers squelch. This receiver can be a handheld
radio operating on simplex, or a repeater's squelch or CTCSS equipped
scanner.

It's a system used typically when multiple organizations want to share
the same frequency within the same area.

There are standard tones, but there are also non-standard tones in use.

These are the 38 standard CTCSS tones used by Motorola systems:

Tone 01 67.0 Hz Tone 20 131.8 Hz
Tone 02 71.9 Hz Tone 21 136.5 Hz
Tone 03 74.4 Hz Tone 22 141.3 Hz
Tone 04 77.0 Hz Tone 23 146.2 Hz
Tone 05 79.7 Hz Tone 24 151.4 Hz
Tone 06 82.5 Hz Tone 25 156.7 Hz
Tone 07 85.4 Hz Tone 26 162.2 Hz
Tone 08 88.5 Hz Tone 27 167.9 Hz
Tone 09 91.5 Hz Tone 28 173.8 Hz
Tone 10 94.8 Hz Tone 29 179.9 Hz
Tone 11 97.4 Hz Tone 30 186.2 Hz
Tone 12 100.0 Hz Tone 31 192.8 Hz
Tone 13 103.5 Hz Tone 32* 203.5 Hz
Tone 14 107.2 Hz Tone 33* 210.7 Hz
Tone 15 110.9 Hz Tone 34* 218.1 Hz
Tone 16 114.8 Hz Tone 35* 225.7 Hz
Tone 17 118.8 Hz Tone 36* 233.6 Hz
Tone 18 123.0 Hz Tone 37* 241.8 Hz
Tone 19 127.3 Hz Tone 38* 250.3 Hz

Hi!

I searching for all information about the "Saiko SD7000" and "Handic
007" Radio-Scanners.
(Urls, Manuals, Mods, Circuits...)
Please let me know if you have some information about this nice old
scanners!

Thanks
Mike

884. Re: HELP! "E Loc" on 760xlt display?

Check the back of the radio for a slide switch and make sure it is turned
off. It prevents the keyboard from working thus preventing accidental
re-programming.

>with a stubby duck at the 1/3 watt. If this is possible with a CAP system it is
>possible any other time with any other system including GMRS with any radio
>programmed for that system.

I have tried to hit GMRS repeaters in my area with my FRS radios.... No
matter what I did... nothing caused either one to open up... Perhaps the
CTCSS tones they used were not one of the ones my radios had... I do not
know. At any rate... I mostly use channel 4, tone enabled....

I have noticed a LOT of interference on 8-14 on my radios during "peak"
hours... would seem that GMRS also interferes with FRS.... but I haven't
verified this by monitoring repeaters at the time this interference occurs.

With OFFSET off, it rounds all frequency entries to the nearest multiple
of the current step size. Which seems to be what you're experiencing. So
you either need to turn OFFSET on or change the step size accordingly.

Stop by my MVT-9000 page to get a copy of my MVT-9000 Owner's Guide:

After I posted my first answer to this question I realized that I may have
been too hasty.

>Scanners by nature will always have a
>location to tap the discriminator audio, meaning that with the right
>software and home brew circuit board, any cheapo scanner can be used to
>decode digital transmissions of any kind, including encrypted comm's

The fact that you have to tap the scanner's discriminator audio output would
likely be construed as modification to allow reception of the protected
systems.

Any techies want to take a crack at this? I recently got a new battery pack for my BC100XLT (handheld). After charging it up and turning it on, now it has no sound and the backlight of the display will not work. It just keeps scanning and scanning, and scanning.....

When I turn up the squelch there is no sound so of course i'm thinking bad speaker, but then again with the light not working maybe there's a bad circuit somewhere.

Any thoughts out there?

What about a scanner such as the Optocom, that already has a discriminator tap installed at the factory?

And as with the past bill, how do they expect to enforce this new law? They can deny type acceptance for new scanners, but the ones that already exist can still be used in this "illegal" manner. And, they STILL haven't addressed the issue of sloppy design of cellular equipment, which is the real problem in this whole thing.

Time to start writing your congressman everyone...

Let's create volunteer cops and get rid of the professionals that
treat people like shit.
I would volunteer to do the job without a gun.

Cops should be allowed to be voted out.

Cops not being required to live with the people they protect(attack)
is what breeds the us and the scum, attitude.

Of course they look like scum to the overpaid suburb living pigs,
that live above the standard of living of their employers that no
longer have any say in their actions.

They commute to hunt the poorest residents and go home to Copland
after a hard day of ruining lives for fun and profit.

Poor Motorola (or whoever is behind this) has probably been advised that they can't sue people who legally reverse engineer "proprietory" protocols and turn around and make and sell compatible products. They can't even do this if said reverse engineering is by direct examination of the hardware [c.f., Sega v. Accolade].

So instead they want a new kind of IP. One with the same features of a trade secret, but without the possibility it can be legally discovered and/or used by a competitor. Kinda like a secret patent, but one you don't have to file with the PTO, has no expiry date, and (even better) the government takes care of dealing with infringers at no cost to the company...

Ah yes, the Free Market at work!!

Naturally, this approach is convenient in that manufacturers can dispense with spending a few dollars per unit sold to add decent encryption capabilities to the communications systems they sell. NSA, FBI, and other elements of the US LENS apparatus give a firm nod of the head too.

Security through obscurity -- and to jail with anyone who dares a peek under the curtain!

roger on the pin.

It is a cheap casting of what appears to be pot metal, probably zink. It isn't even machined. It breaks off. I was able to take the antenna appart, rob a bnc pin from another connector and solder the two together. Really not worth the labor.

To the best of your knowledge, does your local communities use a Trunked Radio System ? Or, are they talking about going to a trunked system in the near future? If they are, you will need the 235. If not, decide if you want to be able to have trunking ability in the future or not. If not, go with the 3000.

In a message dated 2/10/99 4:11:34 PM, JTWard01 writes:
>Sorry, but I don't get your point with this question.

I suspect our efforts should be directed against legislation which adversely impacts the hobby rather than arguing strategies. My point is that the Tauzin bill never had a chance of passage in it's original form. It would have done far more than you describe in it's orginal form - it effectively banned virtually all commercial and private mobile radios, both scanners and two way. It would have taken forever and a day for the chowder heads on the telecom committee to re-write it into a passable form. Any re-write they came up with which actually passed would have failed to meet one of the tests of legit laws - the standard of "reasonable-ness", a word only the supreme court could have come up with. It would never have stood a single court challenge. That's what I meant by asking; "how long would it have been a 'law'?' (not very). But thanks to our help, they got a re-write of the bill that sailed right through. Thanks for nothing.

I guess I'm tired of the attitude - "Yup, nothing we can do, it's going to pass, no use in fighting it, let's just minimize it's impact by working with the scoundrels". Legislation which adversely impacts the hobby needs to be fought - not encouraged. You don't lose your rights all at once - they get chipped away a little at a time. I understand the appeal of working with the legislators instead of fighting. It paints us as the good guys, working with those happy go lucky congress folks. And I'm sure it's great publicity for commercial, hobby related publications. It's hipocracy in it's worst form, in my opinion. It's something I can't bring myself to do, I've been listening to radios for over 25 years. I found the reaction to the Tauzin bill nauseating. Wish we all showed a little more backbone.

I've said it before and I'll say it again, the only thing these guys fear is bad press. What needs to be done is a skillful, coordinated campaign against this sort of legislation - in the press. Forget letter writing campaigns - these guys are in the hands of powerful telecom industry lobbyists. What they need is the spotlight of negative media attention - especially in their home states and national coverage. We all need to stop "singing to the choir", and sing to the American public instead. And not through the internet, either. Heck, my three local House Reps don't even have e-mail addresses, let alone read their e-mail.

I have an inside source at Motorola who advises me this has very little of chance of passage and almost no support. Read the bill again - it's a disaster. But it's the idea behind this recent trend in legislation that scares the pimican out of me. All of it is addle headed legislation that fails to recognize the essentially public nature of the radio spectrum, unlike the original Comm Act of 1934. They are just plain bad bills - and need to be

fought.

Happy Scanning - Ted Moran

Don't give me your bullshit. Your job is to serve and protect. It does not say anywhere that it's to serve and protect only those that sympathize with your beliefs and opinions.

Actually I wished I lived back in the gunslinger days when everyone protects there spread by themselves. If I am allowed to carry weapon freely I doubt if I would ever need your help.

The State of Ohio has recently posted a PDF brochue on their web site with more information. I have a few comments on the content. They mention the system will incorpotate secure digital voice. Let's just hope that this will be an APCO-25 compliment digital system. It also mentions the first phase should be complete by Spring 1999. This includes the Microwave/Data backbone and communications for seven prisions and other youth service facilities. Anyone near a prision keep an ear out for new 800MHz traffic and control channels. This system will be a Motorola, so that is a good thing. Anyone with other info, feel free to pass it along . . .

Jeff

Hi,

The same thing happened to my BC-200XLT a few years ago, when I stupidly touch the wrong place on the circuit board with a lead from my volt meter.

I sent the radio to Grove Enterprises and they fixed what they determined to be a "switching transistor." I would imagine the same thing happened to your scanner somehow.

Absolutely without a doubt we are on the same wavelength my friend.

I know it's a far cry but do you Guys remember that old show on TV?. I think Andy Griffith is the name, you know Sheriff of Mayberry?.

What's the connection?. Well there is a significant difference in his police work and that of the Coppers I have encountered or for that matter read about on the Net or seen on Cops or read in the dailies.

919. AR900 guy

Newsgroup: rec.radio.scanner
Date: 1999-02-10 00:00:00 UTC
From: K patterson <kandtp@fiai.net>
Message-ID: <79t995icl1@remarQ.com>
Source record: 128065

Heres an idea. Instead of giving bogus e-mail addresses in this group (to avoid spam I assume) Why not get a free Hotmail address.(or other such free webbased email service)
I mention this because a guy asked for tips on programming his AR900, and unfortunatly I own one. So I decide to scan and email him a copy. But it bounces. Not until I get the "undeliverable" notice did I see the obvious bogus addy. It was something like Btold_th@thistlebounce.ok
I like to help people, but this kind of thing is a big waste of time.
I know its my own fault, but it really ticks me off.

Now I'll shut up.

I second that idea of buying it from Javiation. You will also benefit from the additional quality control and internal shielding that AOR LTD. of U.K. gives that the U.S has not gotten yet. You will, however have to change the Bandplan as it will be set for Europe and is not in agreement with North America. No big deal though, especially if you use some competent software. Be sure not to bother with the free download from AOR as it is "Crash City". Basically worthless.

Help someone!!
I harpooned a couple of diodes on my pro 2004 while drilling in the back. Can someone help me identify these. They do not show up on the detailed parts list at the tandy site. Someone maybe have a service manual??? They are located on the main board, rear edge near the tape out RCA jack. They are numbered:

D41, D42 - both are identical:glass with a blue stripe.

Thanks in advance

Jay

Probably Computer aided Dispatch for Police Department.

I really doubt it uses cell phone freqs, as it could have no channels to use in
a real emergency. The police have no priority over normal folks on public
cell phones.

At one time cell data contained 2 bits of security or priority settings for
police, govt etc. but as far as I know this was never enabled.

That's funny...I have one of those and, when I use it with my scanner, it is very noisy around 140-170MHz. Several freq's are covered in static when using it. However, when I use it with my 2meter HT, it transmits just fine, but again has trouble with receiving. I've checked out my radios; they work fine with other antennas.

Last night I had the unhappy experience of hearing a vehicle pursuit on the scanner that ended in an officer's death. A two-man Sacramento Police Department unit was involved in a short slow-speed vehicle pursuit, and when the vehicle stopped one of the officers started to chase the suspect on foot (I think). A few seconds later the other officer yelled for code-3 cover for shots fired at his partner. Then he called in a code-900 (dire emergency-all units clear channel). CPR was administered and Life Flight airlifted the officer to UC Davis Medical Center, but all attempts to revive him were unsuccessful. The suspect had shot him with a 9-millimeter handgun. CHP, Sac Sheriff, and SWAT had a very tight perimeter within minutes of the shooting. The neighborhood was evacuated and house-to-house searches were conducted, and the scumbag was finally in custody around 1:30 AM (the shooting occurred at 8:20 PM). According to an officer on the news last night, the officer who was killed had walked up to the suspect's car after it was stopped, but on the scanner I heard that the officer was in foot pursuit. I know that the usual procedure for a felony stop around here is for the officers to stand behind the open doors of the squad car and order the suspect out of the car (at gunpoint, of course), so if the officer actually did just walk up to the car while the suspect was still in it, that would be unusual. I tend to trust my scanner more than the media anyway, but the person on the news who told the reporter that the officer walked up to the car was supposedly a Sac. PD officer. Regardless of what happened, my heart goes out to that officer's family. I never like hearing of an officer's death, but this one bothers me even more because I heard it happen. I will never forget hearing his partner screaming for help and I hope I don't hear it again (unrealistic in this day and age, I know).

On Rich Well's Strong Signals web page there is a quote from Larry Van Horn. He is reported to have had a conversation with one of Heather Wilson's (the sponsor) staffer's who essentially advised him that their intent is to deny access to digital public safety communications to both the public and the media. Her own press release implied that the intent was to make it illegal to modify older "modifiable" radios. Clearly, the bill would do neither. Some very dangerous restrictions implied regarding the publication of technical info. To me it doesn't seem to cover much new ground, but I'll let you judge for yourself...

It's more disgusting special interest legislation, for sure.

I'll be interested to see if the usual "Pillars of the Hobby" (dupes) work with Heather to re-write her inane bill to insure it's passage, like they did last time around. That was one big mistake - IMHO.

I said it before and I'll say it again - if it's a bad bill dont re-write it, fight it! If it's unreasonable, un-enforceable and un-constitutional legislation and it passes we have nothing to worry about. Here it is...

Wireless Privacy Enhancement Act of 1999 (Introduced in the House)

HR 514 IH
106th CONGRESS
1st Session
H. R. 514
To amend the Communications Act of 1934 to strengthen and clarify prohibitions on electronic eavesdropping, and for other purposes.
IN THE HOUSE OF REPRESENTATIVES

February 3, 1999

Mrs. WILSON (for herself, Mr. TAUZIN, Mr. MARKEY, Mr. OXLEY, Ms. ESHOO, Mr. DEAL of Georgia, Mr. WYNN, Mrs. CUBIN, Mr. LUTHER, Mr. ROGAN, Mr. SAWYER, Mr. PICKERING, and Mr. GILLMOR) introduced the following bill; which was referred to the Committee on Commerce

---
A BILL
To amend the Communications Act of 1934 to strengthen and clarify prohibitions on electronic eavesdropping, and for other purposes.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,

SECTION 1. SHORT TITLE.

This Act may be cited as the `Wireless Privacy Enhancement Act of 1999'.

SEC. 2. COMMERCE IN ELECTRONIC EAVESDROPPING DEVICES.

(a) PROHIBITION ON MODIFICATION- Section 302(b) of the Communications Act of 1934 (47 U.S.C. 302a(b)) is amended by inserting before the period at the end thereof the following: `, or modify any such device, equipment, or system in any manner that causes such device, equipment, or system to fail to comply with such regulations'.

(b) PROHIBITION ON COMMERCE IN SCANNING RECEIVERS- Section 302(d) of such Act (47 U.S.C. 302a(d)) is amended to read as follows:

`(d) EQUIPMENT AUTHORIZATION REGULATIONS-

`(1) PRIVACY PROTECTIONS REQUIRED- The Commission shall prescribe regulations, and review and revise such regulations as necessary in response to subsequent changes in technology or behavior, denying equipment authorization (under part 15 of title 47, Code of Federal Regulations, or any other part of that title) for any scanning receiver that is capable of--

`(A) receiving transmissions in the frequencies that are allocated to the domestic cellular radio telecommunications service or the personal communications service;

`(B) readily being altered to receive transmissions in such frequencies;

`(C) being equipped with decoders that--

`(i) convert digital domestic cellular radio telecommunications service, personal communications service, or protected specialized mobile radio service transmissions to analog voice audio; or

`(ii) convert protected paging service transmissions to alphanumeric text; or

`(D) being equipped with devices that otherwise decode encrypted radio transmissions for the purposes of unauthorized interception.

`(2) PRIVACY PROTECTIONS FOR SHARED FREQUENCIES- The Commission shall, with respect to scanning receivers capable of receiving transmissions in frequencies that are used by commercial mobile services and that are shared by public safety users, examine methods, and may prescribe such regulations as may be necessary, to enhance the privacy of users of such frequencies.

`(3) TAMPERING PREVENTION- In prescribing regulations pursuant to paragraph (1), the Commission shall consider defining `capable of readily being altered' to require scanning receivers to be manufactured in a manner that effectively precludes alteration of equipment features and functions as necessary to prevent commerce in devices that may be used unlawfully to intercept or divulge radio communication.

`(4) WARNING LABELS- In prescribing regulations under paragraph (1), the Commission shall consider requiring labels on scanning receivers warning of the prohibitions in Federal law on intentionally intercepting or divulging radio communications.

`(5) DEFINITIONS- As used in this subsection, the term `protected' means secured by an electronic method that is not published or disclosed except to

authorized users, as further defined by Commission regulation.'.

(c) IMPLEMENTING REGULATIONS- Within 90 days after the date of enactment of this Act, the Federal Communications Commission shall prescribe amendments to its regulations for the purposes of implementing the amendments made by this section.

SEC. 3. UNAUTHORIZED INTERCEPTION OR PUBLICATION OF COMMUNICATIONS.

Section 705 of the Communications Act of 1934 (47 U.S.C. 605) is amended--

(1) in the heading of such section, by inserting `interception or' after `unauthorized';

(2) in the first sentence of subsection (a), by striking `Except as authorized by chapter 119, title 18, United States Code, no person' and inserting `No person';

(3) in the second sentence of subsection (a)--

(A) by inserting `intentionally' before `intercept'; and

(B) by striking `and divulge' and inserting `or divulge';

(4) by striking the last sentence of subsection (a) and inserting the following: `Nothing in this subsection prohibits an interception or disclosure of a communication as authorized by chapter 119 of title 18, United States Code.';

(5) in subsection (e)(1)--

(A) by striking `fined not more than $2,000 or'; and

(B) by inserting `or fined under title 18, United States Code,' after `6 months,'; and

(6) in subsection (e)(3), by striking `any violation' and inserting `any receipt, interception, divulgence, publication, or utilization of any communication in violation';

(7) in subsection (e)(4), by striking `any other activity prohibited by subsection (a)' and inserting `any receipt, interception, divulgence, publication, or utilization of any communication in violation of subsection (a)'; and

(8) by adding at the end of subsection (e) the following new paragraph:

`(7) Notwithstanding any other investigative or enforcement activities of any other Federal agency, the Commission shall investigate alleged violations of this section and may proceed to initiate action under section 503 of this Act to impose forfeiture penalties with respect to such violation upon conclusion of the Commission's investigation.'.

I suppose I'm one of those "dupes," because yes, I did work with Tauzin's staff to minimize the impact of H.R. 2369 on the scanning hobby. However, I only offered assistance when it became clear the bill was going to pass the house, which it did, with only one NAY vote. Better to minimize the damage than let a bill that would have virtually made it illegal to listen to anything but broadcast and ham make it into law.
We took our fight to the Senate, where the bill didn't garner enough votes to get out of committee.

A second available configuration is the data and voice system. It will allow all of the previously mentioned features as well as the audio monitoring of the cellular radio traffic. In this configuration, the unit is primarily a monitoring / surveillance / intelligence gathering tool for cellular system providers and law enforcement.

Right!

I have always had better luck ordering directly from National Parts. Less chance of a screw-up, and if the wrong part gets ordered, it is usually my fault. I have had to return a couple items ordered via the RSU catalog in the stores.

By getting the part numbers (You do have the service manual, right?) and ordering direct you eliminate the middle man.

The RSU is a wonderful thing, but you need to deal with the biggest fault in the system, the R/S sales guy. Since R/S in concentrating mostly on other items nowadays, radios and parts are a low priority and they rarely have employees knowledgable in our hobbies working there.

CDPD does indeed use Cellular freqs. Several freqs at each cell site that supports CDPD are dedicated to data.

CDPD stands for Cellular Data Protocol (and I forgot what the second "D" is for) I have my files on this in my office at work so I will have to get the full info later.

For Sale

Uniden Bearcat 210 XLT in excellent condition cosmetically and electrically. I never had a problem with it. The sound is great and the display is a very easy to see bright blue-green fluorescent. This is the best of the 210 series. I really like the forward facing speaker, the construction and the metal case. It has 40 channels and includes VHF Lo, VHF Hi, Aircraft, UHF and one button weather access. I have the original antenna and owner's manual. This unit is very clean compared to any of the others I have seen available for sale or auction. I will take the best offer at $55.00 or above (including UPS ground shipping and insurance in the CONUS). Payment by postal money order only. If you forward your telephone number, I will contact you if you have the best offer.

That is really sick. It's one thing not to like the cops, I used to raise all sorts of hell with them as a kid in my day, but to actually be happy that someone died is really f-ed up. You should be truly ashamed of yourself. What if someone in your family died like that? Would you like me to say "Another one bites the dust" for the whole world to read? What if the officers family reads that?

You really are sick. Go get help.

-Phil

P.S. Not surprisingly, this "person" (I hesitate to use the term) posted this anonymously. If I wrote something as sick and disgusting and heartless as that, I'd be ashamed of it too. What a sick bastard.....

949. Scanner recommendations please

Newsgroup: rec.radio.scanner
Date: 1999-02-10 00:00:00 UTC

I'm new to scanning and I'd like some advice on what type of scanner to buy. I prefer a hand-held unit because 1) funds are limited and 2) I want to have it with me in my vehicle.

I've narrowed my choices to two Uniden models...the BC-235XLT and the BC-3000XLT.

Any advice/recommendations would be appreciated.

Thanks!

Ken Mininger

>

JT,

A couple of questions:

1. Is there anything in this new law that could be used to prevent computer based decoding of these protocols? Scanners by nature will always have a location to tap the discriminator audio, meaning that with the right software and home brew circuit board, any cheapo scanner can be used to decode digital transmissions of any kind, including encrypted comm's (it would be illegal to use such a setup for encrypted communications, but if not to sell the software, and if you used it but didn't tell anyone about it, well you get the idea...)

2. How does the new leglislation deal with the modification of cellular phones? It is much easier for someone to use an old cell phone to follow conversations and clone phones, than it is with a scanner. There are sites all over the web that detail how this is done. Is the FCC requiring the cellular industry to harden it's equipment as well? Unless they are, I can tell you that the new law will accomplish nothing.

-Phil

And another thing: You may be pissed at the cops for whatever reason (which is your right), but I have been pissed off at alot of people in my life. I knew a guy who raped two of my friends and got away with it, and I hated his guts, but as soon as I started wishing him dead, I began to wonder how his family would feel about his death, regardless of his past actions. I imagined myself in his father's position. How would his father feel if his son was wrongfully murdered for something he did years before? Yes, he should be punished, and it is a shame that he never had to go to court or serve time, but no matter how strongly I hate him, I could never kill anyone out of anger. Now, I realize that you and I are different people, but to revel in the death of another human? You are either a very evil person, or (more likely) you are just trolling. Again I say: FOAD!!!!!

OK. Tell me why it happened. Were they just doing their jobs, as the officer was, or were they committing a crime? Tell us the details of the incident, as was done in this thread.

>You may not have said it but a couple of other PIGS in here said just
>that.
And I do not disagree with you that saying something like that is wrong. In the case of the officers who said this, it's also highly unprofessional. If you can, report them to their superiors. Calling them names isn't going to change their attitudes, but a meeting with Internal Affairs might.

>Well thank you, I guess you could say that i'm a product of society.
Oh here we go, the same old tired "Society is to blame" bullcrap. No one is holding a gun to your head and forcing you to commit crime OK pal? We are all masters of our own destiny. If you choose to break the law, don't blame me. Blame yourself.

That's because I don't read that newsgroup. This was posted to
rec.radio.scanner where I saw it.

However, you do have a valid point. When I hear cops laughing about somebody O.D.ing and killing themselves I don't find that funny either, in fact I hold that action to be even more contemptable than what "pissed" wrote. Not only is it just as heartless and cruel, it's unprofessional as well. These people are trusted to serve and protect, not laugh at those less fortunate. I've known several police officers over the years and seen what they see first hand, so I know where that mentality comes from. That doesn't make it right, however, and I won't defend anyone who has such obvious disregard for a fellow human being.

967. Repairing BC200XLT question

Newsgroup: rec.radio.scanner
Date: 1999-02-10 00:00:00 UTC
From: Robert Barile <rbarile@bbn.com>
Message-ID: <36C1EF3A.6D57@bbn.com>
Source record: 128125

I recently ordered some parts for my BC200XLT from Uniden, namely the top most part of the case where the antenna plugs in. I want to replace this because it is cracked and distorted. Please dont ask how this happened. I'm not sure myself. My question is this: If I dissasemble the unit to replace this part, how long do I have before the programming gets lost due to loss of battery connection? I would rather not have to re enter all of the presseted channels.
This will also give me a chance to resolder the antenna connection because this is continuously getting loose.

Robert

968. Re: Scanner Freq.

Source record: 128126

destinyt@pacbell.net wrote:
> ... I was trying to get the Freq. For AAA (Triple A) ...

The AAA was allocated 150.905, .920, .935, .950, .965 and 452.525, .550, .575, .600. There are also some new interstitials (at the 6.25 or 7.5 kHz break points), but they're unlikely to be active.
If you find one frequency in use, check the others in the same group. AAA often splits a metro area into zones, with a different freq. for each.

Source record: 128127

Robert:

Why not just use a couple of clip-leads, from the battery pack, to the radio. This would allow you to have the battery out, but still hooked up. Just make sure you keep the polarity right!

Bill Crocker

Let's see what you are saying: common thief runs from police (felony already, no?) car stop and John Wayne police officer runs up to the door to deliver some good old fashioned beating to common thief and get's waxed and you expect us to mourn. What about the poor street corner vendor that was waxed in NY by 4 police officer having been shot 41 f'ng times.

He who lives by the Gun dies by the Gun, right.

If you are sick of police work and the risks involved, then career change into a Librarian or a (gasp) Accountant. Much safer.

Alright come out of the woodwork Rock, High Crapper, et al I know you are both hiding in the cracks like the roaches you are. Oh oh I almost forgot the other moron Carlos the Jackal.

Fair enough. Tell me what you titled it and I'll look it up myself.

>I highly doubt telling their superiors or IA would get anything done
>about their rotten attitudes. I prefer just to blast back at them the
>way they choose to come at me.

Well, that's your choice, but you can't expect them to apologize to you
after you call them a pig....

>Could you please note what I have done that is a crime?
Can you please note when I said you did? Read the post again - it says IF
not WHEN. My point is simply that I'm so sick and tired of hearing punks and
thugs tell me society is the reason they rob and steal from my friends and
neighbors. That's a load of crap. If I stroll into the bank and shoot
everyone in it, it isn't because society made me do it. If everyone would
stop blaming everyone but themselves for what happens in life, this world
might actually be a decent place to live.

Cross-posted to: rec.radio.amateur.equipment,rec.radio.swap,rec.radio.scanner,alt.radio.scanner

I often hear people looking for the SMA to BNC or PL259 adaptors. A word of warning especially with the little handy talkies puting a big adaptor with a thick cable on a tiny SMA puts a hell of a lot of mechnical stress on parts. By far the easiest and neatest (not to mention cheapest) solution is to get an SMA connector on a piece of the thin teflon coax, about 30cm with a BNC male on the other end made for the thin coax.

Just a sugestion.

>SMR is a speial band, you don't just declare that your freqs are SMRs.

Of course you don't declare your FREQUENCIES as protected, but under this bill the mfgs may be able to protect their proprietory methods of converting analog voice audio to digital modulation and back again to analog voice audio.

>And APCO25 is NOT propriatary, and IS required for new PSB systems.

You're right, APCO 25 is not proprietory and would likely not be protected, but it is a voluntary standard, not a mandatory one.
If you have information that's different than this please cite the source so that I may follow up on it myself.

Hey, lighten up, I was just joking around. Actually, I like both British and ASIAN accents (Oriental is a rug, Asian is a person...Who's the bigot??). I am also proud of being Southern, and I don't see how you could have seen otherwise from my post. And according to my friends in the Sheriff's Office, "Wants" *is* short for warrants, SO THERE! ;-)

I agree with you that it does suck, but it is not the radio. You cannot get good reception with the antenna that came with the radio for the state police. You need some sort of outdoor antenna. Also, the signal is not the good eitther. My father is on the motocycles of Troop D and when he has his radio on and I have the Pro-90 on the same trunked band, the signal comes in very iffy. What troops are you listening to? Are you trying to pick up the Middleboro reapetaer? If you want I can send you the links to some web sites with maps and locations of tower for the SP in mass so you can see what you are trying to listen to and wich ones you should program into the scanner.

989. Calling All Citizens Chat Event RPL111

Newsgroup: rec.radio.scanner
Date: 1999-02-10 00:00:00 UTC
From: dpinero@pobox.com
Message-ID: <36c0ee43.9808380@news.mindspring.com>
Source record: 128159
Cross-posted to:
alt.law-enforcement,alt.radio.scanner,rec.radio.scanner,alt.radio.broadcasting.open,alt.emergency.services.dispatcher

CHAT WILL FEATURE DISCUSSION ON CLOSED BROADCASTING POLICY IN HARRIS COUNTY, TX.

NEXT SATURDAY! :)

Many public safety officials believe that encrypted or "closed" broadcasting enhances officer safety and common-sense security. Open broadcasting pundits, of which many are hobby scannerists, believe the exact opposite and have adopted most if not all of the principles exemplified at http://members.aol.com/truth4000/page1.htm .

Until recently it was a fair democratic debate between experienced, well-intended public safety administrators focusing on security issues; and close-to-the Earth scannerists who fully understood what benefits positively exploited open broadcasting policies could mean. They had after all been taking advantage of a technically-dictated 60-year reign of open air communications.

However, the tone turned ugly in at least one confrontation between an open broadcasting preservationist and his local officials, and it may be a sign of the things to come. A scheduled chat hosted as an open broadcasting advocacy event will focus on censorship-like efforts on a radio monitoring website in Houston, Texas.

John, the webmaster of HoustonScan.com, will answer questions and generally discuss his experiences with Harris County Officials who demanded that he remove a list of trunking IDs from his website. He will also talk about the outcome of his efforts which will inspire, enrage, and shock everyone present.

The chat will be held Saturday, February 13th, at 9:00 p.m. (EST) in the java-based open broadcasting chat room found at:
http://members.aol.com/truth4000/chat2.htm

The chat will last officially one hour. Obviously, however, great discussions are never terminated and may run the gambit of the evening depending on interest and turn out.

To get some background on John's experience, visit his excellent information site at:
http://HoustonScan.com/ and http://RadioScanner.com/

This is a grass-roots philosophical movement. There is no budget, no grand standing, no attempt to judge. The chat, as are all open broadcasting chats, is driven by the wisdom and insight of those who

understand the benefits of open broadcasting, and the threats of public safety systems going closed.

In the event of technical changes or updated chat information, you can check bulletins posted at http://members.aol.com/truth4000/page1.htm . For the truly interested, I encourage signing up with the Listbot-based listserv dedicated to this niche theme. A form for doing so is provided at the above site.

This notice will be retransmitted multiple times until February 13. For your filtering convenience, the key 'RPL111' has been added to the subject line so that the messages will be deleted in your future usenet sessions.

See you there!

I really think it depends on how close you are to a transmitting antenna, because I can put mine down flat on my computer desk and hear everything crystal clear. I suspect there is a repeater antenna close to me. Also, of course, it depends on obstructions and terrain, don't you think?

How is this nonsense any different than the laws already in place? Did
I miss something? Where does it say it will make manufacturing
digital scanners illegal? Also, I was going to write my Congressman
about this bill, but other than wanting to listen to the police, I
couldn't think of a good valid argument why I should have that right.
At least I couldn't think of anything strong enough to persuade them
that I (we) should be able to hear the police.

So long as you don't mind them not getting
it right two or three times running, and then
waiting for a week for them to order it each
time, sure....heck, that's a great idea.

If.....you want it done right...the first
time....there's no better way than to do
it yourself.

Right?

Thank you for the sites to look for the freq. Now about purchasing a up to daye scanner, what would one suggest towards purchasing? I saw a couple base non mobile scanners at Radio Shack for about $199.00 The Sales man says it does 900 mhz. I guess I would need a bigger antenna, because I live in apartment complex, and it has fire wall all around it, and the antennna I have now looks like it works pretty good I guess, I can only get Hayward Signals. I can't get any Oakland or San Leandro Signal. I was trying to get the Freq. For AAA (Triple A) that happens to be where I work and well I would like to hear the dispatcher at night when I'm at home.. My husband drives Tow trucks for AAA in SF and I wanted to see If I could hear him at night.. but If I can't get Oakland and San Leandro I might not even be able to get SF or Livermore. What do you suggest. Do I need a new Scanner and or Do I need a Bigger Antenna?

I had 2 antenna's do the same thing, and Uniden replaced both of them
free of charge, but the scanner was under warrantee at the time. they
also replaced a battery pack for me that would only hold a charge for
about 4 hrs.

Rocky178 wrote:

> Do they use repeaters or simplex. I have all the Frequencies but it seems that
> I can't hear that much. I am wondering. All help will be greatly appreciated.

Depends... some simplex, some half-duplex, some repeaters

Here's what I have for Troop E (Rochester, Canandaigua, Elmira, Corning,
Bath, etc...)

Barracks to car (dispatch) - 154.905
Car to barracks (dispatch) - 154.770
Barracks to car (license/warrants data) - 155.625
Car to Barracks (license/warrants data) - 155.565
Car to car - 154.665
Barracks to barracks - 154.695 (not used much)
Bureau of Criminal Investigation - 155.565 (downstate)

NYSP doesn't make use of vehicular extenders.

Also, most Troop E cars assigned to the Monroe County area are equipped
with Monroe County Public Safety radios (460 MHz - sheriff, Rochester
PD, town/village PD's, etc...) as well as the Monroe County MDT's - and
do make extensive use of these services.

The Thruway troopers use 453.425 and 453.525, which are on repeaters -
in addition to the normal 154-155 MHz troop frequencies.

The 154.665 car-to-car is used for traffic enforcement details
statewide.

It's a waste. Also consider the additional stress it will put on the
BNC conector on the radio which is pretty much fragile as it is.

>>How is this nonsense any different than the laws already in place?

It expands the prohibition on monitoring cordless and cellular phones to PCS devices. It also requires PCS frequencies be blocked from scanners, just like cellular freqs. are now. It also requires scanners to be "hardened," to make it impossible to modify them.

>Where does it say it will make manufacturing
>>digital scanners illegal?

It doesn't. What it does say is that it will be illegal to manufacture a scanner that will decode digitial transmissions from "protected specialized mobile radio services." The definition of "protected" is wide enough to allow Motorola, Ericsson or whoever to claim that their mode of digital modulation (non APCO 25 compliant systems) is proprietory and therefore protected.

Possibly DVP. Motorola's Digital Privacy encryption scheme common among
police departments that want to scramble some transmissions but not all.
They don't have to be trunked to use it.

Check out http://home.earthlink.net/~viperssss/ to identify it.

More likely the repeater is operating in duplex mode (transmit and receive on different frequencies as most repeaters do) and your FRS will never operate in anything but simplex by design. So if you can hear the repeater, your probably transmitting on the output frequency not the input.

One suggestion:

While you've got the radio open, and have dismounted the RF board from the metal casting (rear case) anyway, put a bit of heat sink compound between the two RF power modules and the metal casting during reassembly. This will help keep the power modules cool during high-power transmit.

It seems that the radio won't fry the power modules without the heat sink grease, but perhaps the radio achieves this by backing off on output power when the temperature rises (the FT-51 does this). Better heat sinking can't hurt, and cooler is always better for power transistors.

Dave

I think what is really meant is that if you don't
edit and it's long you make people go through
past excretions and that makes them testy...it does
people no good to reread what was posted.

if you just snip and allow a few sentences to get off
on a subject, like I just did, it helps keep people
at "quiet" with you.

if people want more info, then all they got to do is
scroll back or go to Deja news and find the last few
postings.....

you should edit as much out as possible and make
your reply be what people read mostly of.

most people have read it before...

"The SG-504 provides a leveled output amplitude that is variable from 245 to 1050 MHz in two bands. Frequency is indicated on a high resolution tape dial tht expands each band over 28 inches. The accurately calibrated output voltage is variable from 0.5V to at least 4.0 V p-p into 50 ohms." Includes internal 6 MHz or 50 KHz internal calibration source. Unit is designed to work with standard TM500 series power racks. Amplitude is read out on a calibrated vernier dial. This unit includes the hard-to-find leveling power head which feeds back actual power output to maintain constant amplitude across the entire freq range. Very stable freq and amplitude output. Excellent for calibration of high end O'scopes and for receiver tests with an external attenuator. Includes freq monitor out to fine-tune the freq with a digital counter (not included). Has an FM input for FM of the signal or for phase-locking the unit to an external source. Rear-card connections include FM input, frequency monitor output and amplitude control. Original 1988 Tek cost was $4060. Sorry, no manual included. Buyer pays shipping. Shipping weight will be about 8 pounds from 93523 (CA). I will accept prepayment or COD with certified check/money order, or personal check with ample positive feedback. Happy bidding!

Now come on, calling that thing a scanner is like calling an ICO R9000 a transistor radio. The CAS-8000 is clearly not meant for wide consumer distribution, and is certainly not what the authors of H.R. 514 are concerned about.

I'm not sure, but here's an even cooler application for such a frequency:
Saw a special on the Discovery channel several months ago on lightning. They interviewed a guy who makes a living filming lightning strikes for documentaries and movies down in Tucson. He had a neat little handheld scanner looking gadget in his truck that could tell you, within a few feet, how far away the lightning bolts were. He said he built it himself. I'd sure like to get my hands on one, or find plans for it someplace! Anybody else out there seen anything like this?

I know if you tune to an empty spot on the AM dial during a thunderstorm, you'll hear the lightning strikes on the radio as a loud burst of static. Maybe that's how this thing works...

-Phil

>Now come on, calling that thing a scanner is like calling an ICO R9000 a
>transistor radio. The CAS-8000 is clearly not meant for wide consumer
>distribution, and is certainly not what the authors of H.R. 514 are concerned
>about.
>

OK, while it's true that the CAS-8000 is a highly sophisticated piece of electronic coolness (but you have to admit that it IS the only true digital cellular scanner on the Net that anyone has posted in this newsgroup so far), all high-level technology eventually filters down to Radio Shack customers. It's only a matter of time before there is a digital scanner for sale in high volumes for the masses. Now, whether that scanner can pick up digital cellular or not will depend on H.R. 514, but H.R. 514 potentially will make the CAS-8000 illegal, too. And, no one's talking about encryption.

Clip.

Hey folks - read the article. The officer who was killed worked to try and make his part of the world a better place. It is us, the public who owes men and women like him, not the other way around.

Choco

> suspect was inside car...then jumped out of
> car and fled.

OK, I read the story, and something about it bothers me. Let me state for the record first, I am not a police officer, so my knowledge of police procedure is based solely on what I have seen while riding with officers, watched on live news broadcasts, and heard on the scanner.

Here's what happened, according to the story: Officers spot a car exhibiting odd behavior and the vehicle has a cracked windshield. This usually denotes 2 things:

1. The driver may be intoxicated.

2. The vehicle may be uninsured.

So they pull the car over, and approach the vehicle. No reason to draw a gun or order anyone out of the car at this point. They make contact with the suspect who gives them a name. The story doesn't say they then asked him to show his DL and insurance, but I'm sure that was what they ask for next. The suspect, knowing he is a parole violator and will be discovered, decides to make a break for it.

The officers give chase, and the suspects vehicle stalls. This is where the story gets weird. First off, in 90% of the pursuits that I have watched and listened to, if the car dies, the suspect takes off on foot. However, this story implies that the suspect instead sat in his car. This is not normal behavior for someone who wants to get away. The suspect had ample opportunity to shoot it out before he ran, but didn't. I find that really odd.

Secondly, why was the officer approaching the vehicle without first ordering the suspect out of the car, or at least ordering him to keep his hands visible? This minor traffic violation is now a felony stop. The car is dead, the bad guy isn't going anywhere, so why did a 4 year veteran of the police force walk up to the vehicle without backup? The story made no mention of other officers being around besides his partner, and the story didn't say if they tried to talk the guy out. Plus, they're in a bad area of town! They

just say that the officer approached the vehicle and was shot, while the suspect remained in the vehicle. Then, after shooting the officer, the man takes off on foot. Again, this is weird behavior - why wait to get shot at? Did the suspect think the officer was alone? Even the dumbest crooks know that the cops aren't likely to shoot at you if all you're doing is running away. Why give them a reason?

Then there's the issue of where the officer was shot. Does this strike anyone else as odd? The shot must have happened at extremely close range. The guy would have to hop into the back seat of the car and lay down to fire the shot that the story describes. This brings me back to why in the hell did that cop approach the vehicle at all? If the vehicle had very dark tint, maybe they wouldn't see the suspect hopping into the back, but then they wouldn't have noticed the cracked windshield either. As I read it, failure to follow basic procedure and a lack of common sense got this officer killed. Rookie mistakes. But this guy wasn't a rookie - he had been a cop for years.

Then his partner fires several shots into the darkness, missing the fleeing suspect. My question is, you've already got the gun trained on the car, the suspect fires at your partner and bails, how can you miss? Every person I've ever seen running runs upright. You've got ample lighting from the squad car, clear line of fire, hell it can't get any better than that! Yet the officer empties his weapon without hitting the suspect once.

This story just doesn't seem right to me. I think more went on than what was written. What do you folks think?

-Phil

Here's what I found - not sure how accurate it is.

112 Taxi Inc. (Patchogue) - 152.315/157.575

If you're close enough to the transmitter, it's possible to pick it up
on 800 MHz.

Hi...

I'm selling my new Sony WaveHawk ICF-SC1PC Scanner. This is a 25 to 1300 MHZ Continuous (excluding cellular) Scanner. Like new. Absolutely perfect condition. Includes everything....scanner, antenna, power module, earphone, manuals, PC Cable, PC Control Software (includes FCC CDROM database), etc. 300 channel memory, preprogrammed Service Scan (incl. Police, Fire/Emg, Marine, Air, Weather), Preprogrammed Band Scan, Memory Scan, Programmable Scan, Intelligent Memory, Priority Scan, Selectable Mode (Am, NFM, WFM), Selectable Step, Direct Manual Tuning, etc.

Asking $300. (plus $10, which will cover shipping and insurance to anywhere in the continental USA.)

If interested, please leave me some email, and we can swap particulars.

Thanks...

Ken (N1NEG)

Wiretapping in the State of Florida is a felony. What happened to
the people who tapped/taped Gingrich? This country is no longer a
country of laws - it is a country of gangs with criminals running it.

It is DVP (Digital Voice Protection)...The White noise you are hearing is data. The only way you can listen to it is if you have a radio with DVP Module with the proper crypto loaded. If you dont want to listen to it....turn on your ctcss protection , and when the data comes on, the pl drops (most sytems) so you will only hear it when it goes in the clear.

Is it an ATIS or a D-ATIS? I've heard of the digital atis which allows the information to be displayed on a screen in the cockpit of aircraft which are so equipped. The D-ATIS still transmits voice so maybe you're hearing the digital stuff. I dunno....

>At this point Your Official Representative is going to wrinkle his or her
>brow and muse "Why, then, are you even bothering a *legislator*?!"

I don't think so. Maybe my U.S. Senators might, because they're usually too "busy" in Washington to take notice, but my House of Representative Congressperson always rights back to me regardless of how mundane my letter. What I fear the most is that if you are not, or have never, had a scanner and listened to scanning activity, you really wouldn't know what the hell we are all talking about, and you would probably think we are some type of "electronic eavesdropping enthusiasts" with some juvenile greviences. That's simply not the case: I was trying to point out the practical and informational side of scanning.

>I think you have a problem with priorities.
>
>This idiotic bill, despite its proponents claims it is out to protect
>"civil liberties"[1], is actually yet another threat *to* your liberties.

Well, I really don't want to scan cellular frequencies. Sorry, but I don't find it very practical and informational to listen in on other people's private phone conversations. I really don't see your "right and liberty to scan cellular", either. Could you please defend that in a post ???

>Think about it: it simply makes no sense to make it illegal to
>intercept encrypted transmissions.

Well, you've got a point: how do we know an encrypted transmission is worthy or not of being encrypted ??? If one cop says to another, via encrypted digital, "I'll meet you at the donut shop at 0-600.", we just hear noise on our scanners, and we assume, "Oh that was a tactical encrypted digital transmission, they must be after a drug dealer or something."

However, the legislature has their side of the argument, too, that many criminals have scanners and if they allow digital encrypted scanners to operate without control, the criminals can always be ahead of the police. Well, I say, "Show me the statistics on the number of criminals killing police officers by knowing their location using scanners." And, furthermore, does anyone know of a scanner that will decode digital encrypted transmissions ??? I think even Ted Kazinsky
might have a hard time building one of those.

>My advice to you, if this is really that important, is to 'negotiate'.
>Demand
>*real* privacy for everyone (including the police) or *no one* (including
>the police).

Well, if everything eventually goes digital encrypted, it's basically all over. That's the end of commercial scanners, that's the end of just about every scanner company, too. (Come to think of it, why haven't we heard from UNIDEN people in this newsgroup about this bill ???)

Except, there will always be somebody working in the basement or at the university radiation lab to come up with something for us; there always is >;------|

Gentlemen, you're confusing terms here. There is a difference between digitially modulated transmissions and digitally encrypted communications.

It is already illegal to intercept encrypted communications, whether digitally encrypted or through simple voice inversion technology.

Digital modulation is simply another step toward spectrum efficiency and while there are no current scanners capable of decoding digital modulation it is not currently illegal to do so.

Why are there no digital capable scanners? It's a matter of market size. There are not currently enough communities using digital modulation to produce enough demand for digital scanners for the manufacturers to justify the research, development and production costs to offer such a product. This will change in time, of course, as more communities switch their communities to digital and more folks want to monitor those communications.

Where H.R. 514 poses a danger to the scanning hobby is that it will outlaw the production of scanners capable of receiving and decoding "protected specialized mobile radio service transmissions to analog voice audio." This is a problem because the same technology used for these "protected SMR systems" is used for public safety trunked systems, even though they use different frequencies. Outlaw the production of scanners that decode one, and by default you outlaw scanners that can decode the other.

Well I'm glad for the UK police federation but here in the US you need to understand that almost everyone that is a criminal has a weapon and is not afraid to use it. There has been too many senseless killings here and to protect yourself you need to be armed. I am a reserve with the local sheriff's dept and I would not go on patrol without at least being equal in defense to the people that I run into. It is a way of life here in the US and will be as long as criminals have guns...

>does anybody know where you can get ireland frequencies

For Which part of the country?
http://www.listen.to/isf
is probably the best site but most of the frequencies are for Dublin.
If you are outside Dublin, take a look at the Irish band plan and do
your own searches, Things like the ESB are going to use the same
allocations all over the country so Taking note of what frequencies
they use in Dublin will give you a pretty good Idea of where to start
searching. All Irish lowband and a lot of Highband is allocated in
12.5Khz Steps. Some national lists that i have seen are showing The
Health boards and the fire departments using AM, All the Western
Health board and Mayfire stuff I can hear is actually in FM so it is
quite likely that other regions have gone FM as well.
If you Happen to be in Mayo, North Galway or South Sligo E-mail me and
I will pass on my List for this area.
I hope that this helps.

Whichever one of you wrote it. You should listen to the
one who says above...

I know a few in the news business up there and they
can attest to the "cowboy" attitude that the Sac Cops
have, not only to people, but especially to anyone
who looks or acts as Press. With video cam you are
a target..

i know of two shooters who are suing Sactomato cop
dept for "aggressiveness" beyond what is expected when
a press person is at a scene.

To them the dept is out of control.

I know that what they say is true.

But the problem is with the Mayor of the city and the
Chief of Police who sets policy. And the city council
is responsible too.

Don't blame the cops per se. Get rid of the people
who hire these misfits.

You see, my press friends tell me that most of the
cops in Sactomato, both PD and Sheriff, are outstanding
people in their chosen profession. Friends to all..

But there are more than normal the number of people
with badges who "act as described" or worse.

Remember: go after the people who allow them to be
a cop or sheriff. As long as they stay, the problem
stays. Police Chief or Comnmander...they make policy
and if the city council or mayor allows it to be accepted,

then the problem is more serious.

then it's up to the PRESS to uncover this and allow people to see what's going on.

That is if the parent owner of the Press Company will allow it to be heard on the airways or in the news print.

bill conduit
etc.

I know many fine police officers who never cross the line and come after me...with an ENG on my shoulder. The police chief sets policy. Therefore, the chief is doing right by the Press. so far it's worked. No more IAD complaints from the media. They understand the Press has obligations: the public's right to know.

Other police dept's in the area are similar. But a few are not exactly happy with this attitude.

Way overpriced. For MilAir you need to scan a large number of channels rather quickly, the AR8000 has a lot of nifty bells and whistles but its scan speed is a dog. Go for a BC3000XLT, it blazes at 100CPS and you can search at 100/300 steps/second. The receiver is also excellent, it outperforms my PRO-2005/Opto456 with Probe combo. They are kind of spendy new ($330) but you can pick them up used from $200 and up.

I'm not sure i understand your query?

I did not leave when the cops said to? I stood my ground.
That's how I got the commands to leave on tape. I was escorted
by two cops who I also have on tape leading me away to a more
"safe" area...cop told me to stay in back of cruiser. I told cop
to go to hell. Once he was going back to the scene, I proceeded
to get closer. As I came to get closer the crime scene tape was
being stretched. but I got to get the video.

You see, cops operate under a "think-blink".

they see and they blink and they assume. usually wrongly with thet
Press. They asssume too much and over-react.

My objective is to get video. I cannot argue with the cops
and bring out the Press Code Penal Law they are to obey and
do video at same time.

I work well with cops. I tell them off when they deserve it.
when that cop told me " this is a Crime Scene" I was heard
saying "no, your mother is the crime scene" and then the
cops got riled.

But I got back in. They cannot force me out. They can. But
i'll have it on tape.

You have to understand: the Press and Cops are not friends at
a crime scene. I was the only Press Guy there. It was a good
fifteen minutes later before a staffer showed up.

They imagine all sorts of Press People coming out of the woodwork and going over the evidence and ruining it for them...i kid you knot...

you have to understand how cops think when at a crime scene.

as for me...I know what they expect. I know when to ask questions of the OIC and see what can be done by them for me and my want to get the video of. I don't get hassled like most Press do.

Therefore, my being there is not a threat. Others came and then it becomes a circus. Then they begin to make the crime scene area bigger. bullet casings all over. They have to protect all this evidence
quickly.

I've been at shootings where the Crime Scene tapes are not up. I go in and get what I need, but stay away from any bullet casings or guns or ? Most cops will ask me not to step near a certain area and I do it. It's their request and I understand why?

By my respecting their reasons for being so restrictive they also respect my right to be there...and allow me access that meets with my need to get video of. Within limits.

You cannot Butt Heads with the cops at crime scenes. you just adjust and get as much video as you can and then begin looking around for other ways to get closer.

what the cops do is what cops do. That is how they are trained. once you understand this and then they realize you do, they allow your presence because you understand. That's all they ask: listen to what is before you and obey. Up to a point, I do.

I was not all that far back. 100 feet is within "ouch" range. That's a good distance to what was going on. More than the staffers were allowed.,

that's a wrap, I hope

go to http://www.sacbee.com

there was not video of the incident.

not really sure why? Plenty of
"video shooters" up there. news
hounds.

called local stations and they had their
own stories to run.

SF buys very little from Sactomato
area to use or picks up little off the
uplinks...but if a major shooting of
a cop down here (twice in thelast
few months) Sac stations run them
up there....

it's the Big Market happeneing vs.
the quaint little town of Sactomato
happening.

more news down in SF being aired
of local stuff and up in Sactomato
news may be slow...so they are more
prone to pick up SF stuff for fillers
or for packaging...they did this with
the Dublin Sheriff Deputy who was
killed...sent crews. But that's the
way it is.

that's news biz.

Contrary to "urban legend" in most of the newsgroups above,
"authorities" won't / can't lift a finger unless the party
whose communications are being intercepted files a complaint
which states, inter alia, that the interception was done
withouut permission (an essential element of the offense).

And it should not be. The radio waves belong to the people, period. If you want privacy use a wire or use a digital signal. I find it very intrusive that Congress has seen fit to put it's nose where it doesn't belong.

OK, but first tell me what "shopuld" means. (Or perhaps someone needs to
learn what the F7 key does...)

Give it up, OK bozo? Nothing you can say or do is going to make me blindly follow your "All Cops are Pigs" idiot brainless philosophy, jackass. I'm not saying that there aren't some bad cops out there either. There are. But to lump them all together based on the actions of some irresponsible people who shouldn't have ever been accepted as police officers in the first place is wrong. Most of the cops I've come into contact with over the years have been honest, hardworking people who actually give a damn about society. That's already more than I can say about you.

Think about it.

If you have not figured it out what Congress really
is about?

If you cannot understand what Congress exits for?

Themselves.

Perfect evidence with the House of Representatives (this
name has got to be changed after the Clinton apology is heard)
as to how they really think...they are totally out of synch
with who they are supposed to be representing.

perfect evidence to use is what the H/Reps did with
the Pres. this is abuse of office against the Pres of the
usa. they collobarated against the Pres. they did so by
being "religious" and that doomed them.

they did not listen to who voted them in. and then
scoffed at the polls saying that "no one really will give
a damn two years from now how or what we say or do" with their
little exercise in "abuse of office" at the expense of the
people...and 85 million dollars spent since the HACK, Starr
took over.

or tried to.

Congress has no idea of what they are there for. None.
so they masturbate together and consider that their goal.

in the end: the people - the voters -

it's what they voted for . Change the voters and you
change the elected.

When you think that the Christian Coalition is behind
the attempt to get Clinton out for religious reasons and not
for "laws" then you had better wake up and count the rocks
to begin throwing at yourself.

The HOUSE republicans mostly religionistic fecal matter
who no longer want the Constition to survive. By doing this
maneuver and had it succeeded...thet relgious right could be in control
next time a President is too independent from them...

remember: Pat Robetson still wants to be the Messiah of
the USA. he wants to save us. For his purposes.

you had better learn more about the backgrounds of how the
Congress is when dealing with religion and how it affects
their votes.

Urban myth. Radio waves are not tangible property.

>If you want privacy use a wire or use a digital signal.

I agree 100% but the Supreme Court, the interpreter of our
Constitution, has said otherwise - see below.

> I find it very intrusive that Congress has seen fit to put it's
> nose where it doesn't belong.

FYI - the ECPA is an outgrowth of Title III of the Crime
Control and Safe Streets Act which was passes in the wake of
the U S Supreme Court's _Katz_ decision that established the
legal doctrine of "expectation of privacy" in communications.

All it does is to estatablish a tangible framework in which this
"expecation of privacy" will operate. Nowhere does the ECPA say
that signals can't be intercepted per se.....it says that it is
unlawful if it is done without permission of the sender or
without authority conferred by law. A major difference.

The intent of _Katz_ and therefore Title III was to put
limitations on law enforcemnent in requiring warrants, etc.
The (meat)axe cuts two ways.

I came to the conclusion that those adapters aren't all they are cracked up to be also; after putting one of those with a bigger antenna on my FT-50, I sat on the radio and snapped off the connector. Took a week for the replacement to come in; nowadays I just use the old sma antenna.

If anyone is interested, I posted some stuff on my webpage on how to open up and replace the case on the FT-50, just in case anyone else has done the same thing that I did.

Was it related to drugs? A lot more cops are being shot/ killed lately due
to TWOD
(the war on drugs). A 9mm is the weapon of choice For DD's

I wish that the war would end. lots of good people (cops, children, and
the rest) are DYING because of the MONEY from the BLACK MARKET that the
WAR has caused not so much from the drugs.
Let doctors regulate drugs.

A refurb antennea? never saw one.. But yes they do sell refurbs.. but as far as I'm concerned a refurb is just as good as new.. still has the same warranty and there should not be any defects...

Ah, but there is: I posted it a couple of days ago, and it's called the
CAS-8000 and it's available in Canada.
It is fully capable of scanning and listening in on the conversations from
AMPS-TDMA digital cellular phones. You can see a picture of it and spec's and
description at the following:

Like I told OFR pissed...all of us including me would make a sacrifice to protect people even like OFR, Alciere, mikejm and you. Although you do speak a little more productively and with more thought than the afore mentioned. Some cops won't display their feelings as much as others. And yes, some may be a little more joyful than others when a turd is killed. (One that had no regard for human life except for his own) Actually it's pretty sad when you arrive on a call in a dark, stinky, smoke filled roach motel room to find a lone person lying half on a bed, and half on the floor. Eyes rolled back in his head with a needle still in his arm. You actually think of how miserable it would be to die that way and what brought the poor soul to do that with himself and to whatever family he might have had. But as I was saying, most cops take their oaths to heart and hold it true to their heart. Just watch what you say because you cannot control what will happen to you in the next half hour, day, week, month or year. You might be the one lying pinned in your overturned car with gas running down, and the next thing you know there's a cop ripping the door off or crawling into the broken window, sacrificing his own well being to save you. How do I know this?? Many of us have already done it.

Hey guys...I just got one a week ago and had a few questions:

How long are your nicads lasting? I've been charging them for 11hrs each but only get 4-5 hrs of scanning out of them if I'm lucky. (glad they supplied 2!)

Anyone know if they're gonna supply that dry cell option for the AA's they show in the manual?

Boy that preprogram muted frequencies bug REALLY SUCKS ALINCO! It would be nice if they gave us the computer cable/software to reprogram it for free. Doing it manually will take forever.

Who needs the cell unblocked when those images at 1420 are soooooo clear?

Anyone know how many amps this thing draws? I'd like to get a ac/dc converter to use at home so I dont go through the nicads as fast.

Thanks.....

John

It is my turn to ask you what you are babbling about.

Clear Thinker posted a direct opposite of what you wrote and I quoted: you said the Cop got shot while walking up to the car, Fuzzy Blinker said not true that Cop got shot on a foot pursuit.

Comments directed at Fuzzy Blinker not at you.

DO you need me to write a little bit more slowly so you can comprehend?. BTW thanks for clarifying the Press safe distance issue for me.

If you send a letter to your so-called "representative" that begins:

Dear So and So,

I write to you today to express my dissatisfaction with the
current HR 514 bill. I'm sure you've heard alot of stuff about
citizen's rights and legalities. Let us forget them for a moment...

At this point Your Official Representative is going to wrinkle his or her
brow and muse "Why, then, are you even bothering a *legislator*?!", and
deep-six your missive, remainder unread.

> If every major law enforcement
> agency (with the finances to do so) goes digital, and that becomes illegal to

> not be avoided.

I think you have a problem with priorities.

This idiotic bill, despite its proponents claims it is out to protect
"civil liberties"[1], is actually yet another threat *to* your liberties.
Rather than offering *REAL*, provable, privacy to cellular phones and PCS
devices, your glorious government is simply offering you yet another
feeble, worthless, promise: a mere "right" to privacy.

That is to say: instead of the government *ordering* manufacturers of these
instruments to build in privacy, you have the manufacturers *ordering* the
government to enact unenforcable law. And attempt to enforce it anyways at
your continued expense. Of course.

Think about it: it simply makes no sense to make it illegal to
intercept encrypted transmissions. Yet it is in the USA. Are not your
jails full enough? Time to put people who might listen to random noise in
the slammer too?

You have exactly one guess as to why this paradox exists.

> If the price one
> has to pay for digital communication is total lack of information and total
> control by the police over their actions with secrecy and hidden operations
> from the public listening in, then all of us who "could have bought a scanner"
> will become "stupider" or "more blind" to our environment, instead of having

> more awareness emergency situations, of our surroundings and our government,
> and how our taxes are used by those government workers we citizens employ.

My advice to you, if this is really that important, is to 'negotiate'. Demand *real* privacy for everyone (including the police) or *no one* (including the police). Let those be the extremes, and proceed to binary search to a suitable accomodation. For the pattern of law that is being laid down now in the USA -- and likely to be copied in slightly more civilized climes like here in Canada and other places -- bodes ill. But you must understand this isn't because you can't watch the Donut Tactical Channel (ie, police MDT's) anymore...

[1] The notion of a "civil liberty" violation, because some pimply geek with a scanner might be listening to the failings of your relationship you choose to broadcast with a cordless phone, was one of the more amusing lies. Maybe a crime was committed. Perhaps a tort could be adjudged. But as far as I know, no civil right violation would take place unless the aforementioned geek was in the employ of the government (probably a LENS operative), and done on government time for government purposes, but ultimately lacking constitutional sanction.

If you're interested in military monitoring then you should join join MilCom, the e-mail listserver dedicated to military monitoring.

To join:

Send an e-mail message to: majordomo@qth.net
In the subject put: milcom
In the text area put: subscribe milcom

That's all there is to it. You should start receiving messages within a few hours.
To post a message to the list members address it to milcom@qth.net
We have members all over the country, in Europe and Japan.
For help finding frequencies in your area just post a message stating your location
and requesting frequency help and you should get some answers.

But there is no practical need (or tax funds) to encrypt or scramble every bit of information sent, just to "foil the scanner people." Spend millions of dollars to stop that "geek who listens to the police" ??????
How about encrypting only information that threatens someone's life, or can be used against that person.
"Reported roll-over accident at Marker 34" is hardly a message that can be used to kill a police officer, or threaten someone's life.

This has been a fact brought to the surface many times. "Proudhawk" hangs
out in all the same radio & blind newsgroups that Eric hangs out in &
always jumps to Eric's defense. Yet they deny being eachother.

You are, it appears, totally unfamiliar with the ECPA which
specifically prohibits such eavesdropping of cellular
(analog or not) and, more recently cordless.

>Which BTW you could also use in defense against Virginia's anti-radar
>detector law. Since the federal law on this supercedes Virginia's law.

So how come the law is still on the books in VA? The folks
at R.A.D.A.R. have not successfully been able
to win a court case against the law...as far as I last had
heard.

>IF however, you encrypt, even if it's the simplest and easiest to break

>you wouldn't want the world to know.

Regardless, it s still against federal and manay state laws
to listen on cordless and cellular. That doesn't change
the fact, however, that anyone listening has about a zero
chance of being caught unless the overtly make themselves
known to authorities as doing so.

Cheers,

Well, it depends upon how much you want to spend. Whichever route you go you want to make certain that the radio not only covers the 225-400 range, but also allows you to manually set AM mode in the 138-144 range.
Perhaps the best buy would be a used Pro-43 or Pro-60. Pro-43s tend to be a bit more expensive since many can be modified to receive cellular. Used Pro-60s run about $125 to $150, and IMHO have better audio than the Pro-43.
Next step up the ladder would be the new Sony SC-1 ($279) and SC-1PC ($329 or so).
Then would come the Uniden 3000XLT (or a used 2500XLT), and then the mega receivers such as the AR8000, AR8200, Alinco, Icom etc.
I've owned the 3000XLT and AR8000, and I'm currently using a Pro-60 that I bought for $100 and I'm quite satisfied with it.

I agree completely. You need to differentiate between digital modulation and digital encryption. They are not the same. It is currently legal to monitor digital modulation systems (although there is no scanner capable of doing so) and illegal to monitor digitally encrypted comms. This new law could prevent the manufacture scanner capable of receiving digitally modulated signals and converting them to understandable voice audio.

We feel for the 'good' officer who lost his life in Sacramento, Calif.
There are and always will be 'bad apples' in every/any government position
(federal, state or local) where they are entrusted by the public. As was
stated by a level headed individual in an earlier post, logical/reasonable
people don't let the bad apples sway the general opinion that these public
servants are in general, providing us a great service.
Hooray to all the law enforcement out there. Who is this guy going to
call when his house is being invaded by robbers? Burning your bridges can be
detramental to one's health.....good day

Well, having read this thread, there are a few things I have noticed :

1. The original message related hearing a foot pursuit called on the
radio. Foot pursuit is not called when approaching a stopped
vehicle, So the 'John Wayne' reference was obviously spoken by
someone with mouth engaged and brain in neutral (resulting in torque
rotation that shows his ass).
2. Andy Griffith was in a fictional town, with fictional characters,
and Copland exists in a movie. Come out of fantasyland and into the
real world. Cops do not get paid enough to live in sealed communities.
They live amongst the people they are sworn to protect from those in
the world who have no respect for the rights of others.
3. Believe what you see/hear as it happens, not the edited, sanitized,
and p.c. screened media reports. If you have any doubts,at the next
crime/accident/disaster you are unfortunate enough to observe, see how
accurate the following media reports are, compared to what you know
first hand.

And.. something that just seems odd to me.. EuroMeko (of TeamEuroMeko)
does onsite as opposed to customer going to them. This is the person I
want coming to my business to work on my systems? ummmm nope, dont
think so. You are judged by the company you keep, and you judge a
company by those they keep.

I'm not saying that all cops a perfect, when in fact many are not. But why judge all cops by the actions of a few bad apples. I do not think a cop deserves a medal for shooting an unarmed man 40 times.

I think that vast majority of the cops on the street are good cops and deserve our respect. But there are some bad cops and unfortunately they get all the attention. I never said they all were perfect.

I was upset because you started ragging on a cop who had just been shot and you did not know him. You didn't even know if he was one of the bad apples.

Eveyone is entitled to their own opinion and you deffinately have an opinion on this. I just don't have to like or agree with your opinions.

Before you can experience how a cop
PEES you must become a cop first and
PEE with him or her.

Cops PEE differently.

understand this and you see how
cops think.

Again, first walk in their shoes as a COP.

You won't be so trigger-happy to put them
down for what you consider to be unprofessional
as you see it from inside your safe-house with the
blinds drawn and the lawn spiked with land-mines and
iron gates and a moat and a surveillance system all
around your fortress to make it safe for you.

they are out there on the street. Their perspective
is not as protected as yours is.

bill conduit
etc.

Could you be more specific as to the date of this alleged
incident. I've been doing searches on the subject and
so far nothing has popped up on TV sites ... did this really
happen?

What date was this? I've seen nothing on the wires
about it.

So, what are we dealing with here? Imagination or Fact.

was this the first post about this subject? If so, how
did the subject get so far off center?

update on last message: my server will not cancel my
message....what?

the story is on http://www.sacbee.com

it seems the officer was shot by suspect while
suspect was inside car...then jumped out of
car and fled.

bullet holes in auto glass

the chase occurrred after the shooting, not before.

so why did not the officer ask suspect to get out of
car first with hands in air...we will never know.
what the "listener' heard we will never know exactly
what was heard or what the cops said to the suspect.

What station MIKE?

I missed whatever coverage the
SF stations did on your city's
sad day.

I was the videographer who got
the Dublin Incident a few ago
your station probably used.
Unless you are with KCRA and
really got burned when KRON
overnight idiot woman bought
an amateur's stuff and not mine.

KCRA was not very happy with what
KRON bought...and sent them.

my video came in via News One and
CNN.

Mr. Thinker or should I called you Clear. Wait I get it let me just call you halfwit listen up and this may sting a bit:

I don't need your stinking money or business onsite or offsite. How's that?.

I know you lack the wherewith but the post I read said that the LEO walked up to the car as opposed to ducking behind his door (I am not a LEO all I referenced is what I read in the thread)

Real Cops live in the community they serve. Cowardly uncaring LEO live in other cities and that is my reference to Mayberry.

good example of this is the COP KICK video
of mine used by the many stations who picked
up on it.

if you had not been there and just saw the video
the tv stations aired you would think that the
cop kicked the suspect in the balls. Loud outrcy
was forthcoming from every screwy brain who wanted
to go after the cops for insensitive kicking.

Being the press I was able to get in and set up for
what occurred. The cops did not have time to
stop me. I get there real fast. Assume a
professional attitude and find a safe place
to begin videoing the incident.

What the viewers did not know was that the
suspect had a gun in his hand. A 9 mm.
automatic which he used prior to my getting
there. He was spraying it all over as the
bullets came forth.

Cops returned fire. Hit the bugger six or
seven times and he went down. I got there
as he was put on ground by a dozen cops who
swarmed over this de-facto nothing.

I could have been there when the shots were
fired by had to keep pulling over to allow
cop cars and fire trucks to pass me ... damn.

The guy had a gun in hand still. The cops
were trying to get him to let go of it. he
would not. so he got the KICK. Good move

on the part of the officer. It got the
suspect's attention.

when I saw it happen I said " that must have
hurt?"

But I too thought at first he'd been deballed.
That was my impression. And I was not more
than 100 feet from the action going on.

The video made it look like "crotch-kick"
in place. wrong assumption.

Upon review afterwards as I looked at it
on my monitor when making dubs you could
see that the officer indeed did kick him.
But upon close sight you could see that
the officer kicked him beneath his balls.
Like in the upper part of his leg. But
below the "ouch" sack.

You see, he never doubled up when the
kick was finished. he remained prone.
if he had been deballed, then he would
have raised up in pain as the kick was
on target. he did not.

Loud outrcy about this one also. Cops
were on "high times" there.

so, just because you see it on video
and tv stations give play by play explanation
of what is going forth...

it ain't reality.

The video appeared to be
The results were not as appeared to be

You might get to see it again if
20/20 decides to pay me for allowing
it to be aired on a special they have
coming up. But first they have to
c contact me with an offer of money before
that happens. They have the video.

People...Video is not reality. It's a
vision of what the taker sees and captures
and then what an editor decides to cut and
save.

Life is not an editor's back-yard.

What you see on TV is "a possibility"
it occurred as you think it did.

I can tell you from first sight being
there that I thought he was deballed
too. That is "100 feet" view. It
appeared he was deballed.

you see, even being there watching what
the cops did, i assumed they did what they
did not do to this criminal. He's a three
time loser.

so with the officer thing in Sactomato,
people are assuming what happened and if
you read the newspaper accounts vs the
guy who heard it on his scanner, well,
you decide.

No mention was made by poster of the
cop being shot from inside the car out
to him....

You had to be there. with video cam
in hand at that moment.

Reality is what the police report makes
it up to be. Unless there was a video
account of it. Then it gets edited into
being real.

Remember: I was there as it occurred. I
am a very acutely minded videographer who
misses nothing when at work. I see and
what I see is on video. Even though
I thought I saw this guy being deballed,
it did not happen as I thought it was done.

The video proved what really happened from
looking at raw tape. Too bad the video had
to be interferred with by some "cowboy" cop
who saw me and "ON VIDEO" told me to get out
of the crime scene. IF he had not then I
would have had video of the cops with the gun
that was released as he was in his gained PAIN.

the cops had to get the gun out of his hand
for their safety and for the safety of the
people who were watching from their porches
and windows and the safety of the professioanal
at work, me.

Had not that cop opened his mouth against me
being there (I have every right to be), the

gun being released would have been caught and
the cops picking it up would have been seen
on video. f

You see...not all cops are smart when it comes
to dealing with the Press. Hindsight he may
wish he had just kept his mouth shut.

Emotions do funny things when a bank robber
opens up on you with a 9mm. automatic ... u
lose your cool and assume a new identity.

just in:

cops chase suspect, cops shoot at suspect
suspect gets away in car, cops force suspect
off road....etc.

did anyone have first=hand account via their
ears on this one...tonight: feb 11, 1999
early morning probably. Just heard about
it. WEdnes night or Thurs morning.

would be nice to see print/tv version vs
whatever the listener on scanner heard

Manteca is in the San Juaquin valley of
California on your way to Fresno southerly.

or it's on your way to SAcramento if coming
northerly...

or it's on your way to SAn Jose if coming
in from Yosemite.

it's a small town.

any small-town listener out there get it?

Question for you Bay City Video Group:

If you are indeed within your right to video tape, why did you then leave when the Cop said to?. I've always wondered why some TC camera can get up close pictures and some shoot from so far away.

Learn me something please. Thanks.

Frankly there is no area between 40 and 1000mhz that I feel the R2 does not excel in monitoring with it's superior sensitivity. Intermod in that region is nill. It is at it's worst in the 450-500mhz region with pagers and such, although I find that kicking in the attenuator works great here. Otherwise no worse than the best out there for intermod.

>From: mdf@my-dejanews.com

>Security through obscurity -- and to jail with anyone who dares a peek under
>the curtain!

There are more immediate "practical ramifications" at stake, here; forget about citizens' rights and legalities for a moment. If every major law enforcement agency (with the finances to do so) goes digital, and that becomes illegal to intercept, or goes encrypted, and that becomes illegal to intercept, simple situations like traffic accidents and problematic "real-time crime areas" will not be avoided.

I don't want to rely on CB channel 19 to tell me where there is a roll-over accident ahead. I don't want to go to the 7 Eleven to buy a quart of milk and find 12 police cars parked in front after a robbery/killing. If the price one has to pay for digital communication is total lack of information and total control by the police over their actions with secrecy and hidden operations from the public listening in, then all of us who "could have bought a scanner" will become "stupider" or "more blind" to our environment, instead of having more awareness emergency situations, of our surroundings and our government, and how our taxes are used by those government workers we citizens employ.

The Mass SP do use mobile extenders, the only freq I can remember offhand is 154.920, and it extends the low band system from the cruiser to the trooper, it does not work from the barracks.

In Eastern Mass. (maybe the whole state by now) the State Police have switched to an 800 Mhz. trunked system, and operate much of the traffic on this system. The troopers have 800 mhz portables, which makes the extenders pretty much obsolete.

Hope this helps.

Ed

Yes, they DO choose their line of work, to protect scum like you. Contrary to what you have forced yourself to believe, not all cops are bad. Some, yes...hell, maybe even most, but NOT ALL. Let me ask you a serious question: Would enjoy the death of a good cop? I mean, a cop who really loves people, who does his job the way it was meant to be done? I want an honest answer.

Your problem is the Q201 transitor burnt out because the c36 or c55 capacitor shorted out.
The capacitor is a 220 uF 10v electrolytic.The one that burnt out on my radio was right by the red power lead from the battery where it went to the cicuit board. As for the transitor i couldn't find one locally so someone told me to jump it with a doide.The radio has been ok eversince

Hi,
Anyone who wears a police badge doesn't deserve the breathe they have.
I rejoice every time I hear that one of those scumbags is killed.
No, no pigs will ever be helping me, it is their duty to use
everything against me, they are they greatest enemy to free
individuals that there is.

Well so much for having a firm grasp on reality!

1175. FS: Bearcat 210 XLT in Excellent Condition

Newsgroup: rec.radio.scanner
Date: 1999-02-12 00:00:00 UTC
From: Howard R <miymale1REMOVETHIS@hotmail.com>
Message-ID: <36c472a0.0@news.access1.net>
Source record: 127740
Cross-posted to: alt.radio.scanner,rec.radio.scanner,rec.radio.swap

For Sale

Uniden Bearcat 210 XLT in excellent condition cosmetically and electrically. I never had a problem with it. The sound is great and the display is a very easy to see bright blue-green fluorescent. This is the best of the 210 series. I really like the forward facing speaker, the construction and the metal case. It has 40 channels and includes VHF Lo, VHF Hi, Aircraft, UHF and one button weather access. I have the original antenna and owner's manual. This unit is very clean compared to any of the others I have seen available for sale or auction. I will take the best offer at $55.00 or above (including UPS ground shipping and insurance in the CONUS). Payment by postal money order only. If you forward your telephone number, I will contact you if you have the best offer.

Please do not respond through this newsgroup. Respond directly to the following e-mail address, less the NO SPAM trap: miymale1REMOVETHIS@hotmail.com

> aren't quite this well made, but oh well.

The problem comes from the SMA connector--it has a small diameter outer conductor (the threaded part). It inheriently will not take much force to snap it, regardless of how well supported it is in other places. I'm glad that you haven't had any problems with yours, but that may be because, unlike me, you try not to sit on your radio. If you're careful, then there shouldn't be any problems with these adapters; I think this thread came about though because us hams tend to "abuse" our equipment, by making them do things that it wasn't intended to do.

Just my two cents.

By the way, I've dropped my radio at least three times, and once from a height of about 6 feet. No damage yet.

> ...and who are you calling peacemakers?. not the blokes that shot an unarmed
> man 41 times are you...

Why out of the thousands and thousands of calls everyday that police officers respond to everyday do you continue with this one incident. I was an officer for over 15 years and dedicated my life to helping others in both dangerous, sometimes sad and many times humorous situations. We are not all perfect and there are times that during the heat of the moment we are required to make split second decisions that will be arm chair quarterbacked for years by people sitting in their cozy offices that have never spent a minute on the street in the capacity of a police officer. If you choose to continue with this one...an innocent man was shot 41 times line of reasoning why not balance it with a thousand or so incidents where a police officer saved a life or aided a citizen in need. Remember the old saying the next time you are in trouble call a hippee...who are you going to call the next time you are in trouble? No doubt it is going to be a police officer who doesn't know what you have publicly said about him...and even if he did know I can gurantee he is gioing to help you just the same. I understand that during these times it is "in" to bash authority, and I hold no grudge towards you eventhough you continue to show your ignorance and sheep like mentality, and if and when you need "me"...I will be there.

Source record: 127789

While I was preparing a message for Andrew down in Canberra Australia about S.A.M.E. RADIO I found something we can use everyday. If you can feed the audio from your scanner to your sound card you can broadcast that all over the world on the Internet for FREE. Since a few sound blaster cards and especially the new SBLIVE can simultaneously process multiple input streams you can also add your own comments via a mike or mix audio from broadcast TV or local radio commentary. I don't know how to put it into words, but the implications of this if properly done are immense to those of us who would like to have been on the scene of breaking action in a distant community. You could become a CNN center of one all by yourself in your home office! You could even do this with a decent portable PC and some hand held radios or portable TV's for input at an evacuation center.
Ok where did I find it? Check out
radio destiny RN
Broadcast internet radio with our free streaming audio software suite. Convert wav files into streaming web sound clips. Play our free ...
Download the receiver then
Play our interactive real time Radio Play

Stations which are live now:
New chat facility so broadcasters and listeners can talk with one another.
You need to upgrade your Destiny Station to version 3.06 to get listed. Lite 3.06 Professional 3.06
Have I tried it yet. No. But in scanning the list of those who used radio destiny RN in the last 24 hours I see that a few scanner users have already broadcast local chatter from their scanner radios. Now this would be boring to me here in Atlanta GA to listen to traffic stops and such in say Chicago but if a terrorist attack went down in Chicago, I would be very interested in listening to the breaking news live as it happens from an Internet Source. Hey even that fire a week or so ago when the FORD power plant blew up would have been interesting IMHO.
I have cross posted this to several mailing lists (a fraction of the ones I subscribe to) so if you get more then one copy of this message I apologize in advance. If this interests you can you would like to discuss it in more detail and this is too far off topic to your mailing list please subscribe to 4phun-Scanning@onelist.com by going to this link 4phun-Scanning. 4phun-Scanning is devoted to general talk about everything from the weather to anything you can monitor using a wideband radio scanner. Hey we even talk about other high tech topics (toys) if anyone feels we all may be intested, but the basic theme is scanning and what you may hear. BTW we use HTML formatting on the 4phun-Scanning mailing list as modern RTF messaging befits a high tech group.
If it isn't too far off topic for your list then discuss it there as I will see the discussion anyway, remember I am a lurker on your list anyway. One list I did not post this to was SCAN-L. Peter Laws' SCAN-L can't handle RTF messages. If someone wants to translate this to old ascii text and forward the information to SCAN-L have at it.
Today be safe and have phun

In the city where I'm an officer, a Slow-down or a slow-one means that the dispatchers know it's an old call, one that is of a low priority and has been pending for more than an hour or so. It means to take a ride by but kill yourself getting there...(if no one goes, even if the problem has self-corrected prior to dispatch, the initial caller will still call the Chiefs office in the morning to complain about the lack of response...so go, make our presence known to avoid a complaint.) The other responses are also correct...advising additional responding units to slow down but continue their response to a crime-in-progress call. There are many law enforcement terms that mean something different depending on the part of the country, size of the department, degree of workload, etc. Tom KB2FIK

Becasue I can, you probably want us to go to the PD and ask for permissions before posting articles on the net. Also it's becasue it is the most recent one that's why. The poor bastard's family that got shot probably doesn't have Internet back in his village in Guinea (sp) I will make sure though that I use my Internet capacity to promote the issue. How's that?.

>as an officer for
>over 15 years and dedicated my life to helping others in both dangerous,
>sometimes sad and many times humorous situations.

That is the job you signed up for. Don't ask me to pat you on the back, you get paid for doing that. If you can't do it anymore go into another line of work.

>We are not all perfect and
>there are times that during the heat of the moment we are required to make
split

I have been on numeorus ride alongs - This does not make me a LEO but I have seen what you see. But it comes bacl to the same f'ng thing I say. If the job is too hot for you that you will start shooting innocent people maybe you should career change.

> If you choose to continue with this one...an
>innocent man was shot 41 times line of reasoning why not balance it with a

>thousand or so incidents where a police officer saved a life or aided a
citizen
>in need.

Beacsue that's what you are expected to do as proffessional peace officers. You don't read about Doctors saving lives everyday do you?. That's right you only read it when they forget forceps inside some schmuck.

>Remember the old saying the next time you are in trouble call a
>hippee...who are you going to call the next time you are in trouble?

I will call the police that's who I will call. We gave up our rights long time ago and gave it to the police to help enforce it. This does not mean that I agree with it but the majority rules. If you don't want us to call you, give us all our tax money back and lift all your stupid gun laws and see if we can protetc ourselves or not.

> No doubt it
>is going to be a police officer who doesn't know what you have publicly
said
>about him.

You are a complete moron. I see it must be that fraternal bullshit of yours. My beef is with bad cops not the good ones. So any good cop should not have to label me anything. Maybe you are becasue you are a bad cop.

>..and even if he did know I can gurantee he is gioing to help you just
>the same. I understand that during these times it is "in" to bash
authority, and

you cant get cell calls with this scanner anyway so why advertise as such.
now you can do a down conversion which then blocks the cordless phone freqs.
but this scanner will NOT pick up cell freqs.
Eugene Protas wrote in message <36C38ECD.1A204791@flash.net>...
For Sale: Pro64 400 channel handheld scanner. Triple conversion 800mhz scanner, programmable by computer with optional interface cable. Coverage from 29 - 960mhz. One touch weather. 17 Band service search. 50 channels per second Hyperscan search speed. Potentially modifiable to receive full 800mhz coverage (see link: http://members.aol.com/noobody/pro64vdc.htm) Note: It is a Federal offense to monitor cellular frequencies. Originally $299.99 in Radio Shack 1998 catalog. In "like new" condition, only $150 plus shipping from Houston, TX.

1197. Best scanner for $200-$300 range

Any suggestions for a decent scanner with in this price range? It's main purpose would be listening to local police, fire, local mil base, etc... Also ease of mod should probably be considered, (for educational, of course) Please respond to rhammer@niu.edu.

Thanks!

Most likely what you heard was Teletubbies communicating with their mothership.
Actually, you were hearing an image (harmonic) of their telepathic frequency.
Nice catch, though. They usually scramble their comms. You should consider
yourself a very luck radio enthusiast. 73

Take any AM radio and tune it to a dead spot near the bottom of the AM band. Say, 550 to 900 kHz. You will hear the lightning miles and miles away as a crashing sound. One you hear the first one, you will know it.

The PBC show about bad weather that was on recently showed a guy tuning in his radio was explaining that "what you are hearing now is the sound of lightning." The only problem is, for anyone who has ever done this is that, there was no lightning crash being heard.

Just film makers filling in what was left out.

Try it, it's really very simple.

Source record: 127811

For $219.95 you can have what is one of the most sensitive scanners on the market with 200 channel memory, the smallest size available, incredible audio quality and superb battery life using only 2 AA batteries. It is of course the Icom IC-R2. I don't mean to offend any Radio Shack or Uniden product owners, but quite frankly this is a superior product. If you require a keypad and don't feel comfortable without one, the other choice would be a Relm HS-200 for around the same price. I do know that on the R2 all you need to do is tune between 490 and 520mhz @10khz steps and you will receive all of the cellular images you can stand, so a mod is not necessary.

>Hope it makes sense
It isn't that simple. If you have the right equipment, you can charge
at very high rates, however the charger has to monitor battery
temperature and voltage carefully, and reduce the charge rate
accordingly.

Most NiCd's are charged at C/10 because you can do so for long periods
with minimal (not zero, minimal) damage to the battery, and still
charge in a reasonable period of time.

For longest life continuous charging, lower rates are desirable,
however the charge times get very long, and that limits the
usefulness. Generally if charge at less than about C/35, you may never
fully charge the battery. C/30 provides just about optimum battery
life, but it will take several DAYS to fully large.

Ultimately prolonged charging boils the electrolyte away resulting in
battery failure, however it take s lot of charge to convert
substantial amounts of the electrolyte into hydrogen and other
things..

I don't see many posts on the BCT7. I've read the manual and the specs and it seems to be a decent mobile unit for driving in other states without doing a lot of programming. The highway alert sounds interesting as well.

Does anyone have any experience with these? Would you rate it good, bad, or mediocre?

It's ok. The unit gets a lot of interference from cell phones while
trying to monitor 800Mhz frequencies.
You can't control the delay. All channels have a two second delay.
Volume is good and this scanner has CB coverage.

> ...would be listening to local police, fire, local mil base, etc...
>Also ease of mod should probably be considered

If you don't require a trunk tracking radio, the two best
values in a portable scanner are currently the:

1. ICOM IC-R2
2. RELM HS-200

Each provides the most performance and feature mixture per
dollar spent.

The IC-R2 has much wider frequency coverage, is physically tiny,
and only requires 2 AA cells. The HS-200 has a full numeric
keypad, scans faster and has digital coded squelch (DCS).
Both incorporate CTCSS as standard.

This does not take "ease of modification" into account.

>people who did it to Newt weren't wiretapping. Where's the wires? That's
>why new laws are needed.

The folks who monitored and taped Newt violated existing law. No new law is needed there, however, I can understand wanting to extend coverage of the existing law to 900MHz digital cells and PCS service.

The disturbing part of HR 514 is the broad definition of "protected specialized mobile radio service" that could be interpreted to encompass some public safety systems.

Terrible to use around town because of the intermod/interference, Great to use on the highway. I've noticed that some states must have their mobile extenders transmitting all the time because the BCT-7 picks them up with great accuracy. In other states, the BCT picks them up if they are out of the car but not while they're rolling. Have others noticed the same?

Great for searching for local frequencies while traveling in less populated areas.

73,

Mac

recommend reading "Transparent Society" by David Brin.

there's no guarantee that the "encryption" of today will remain secure in
the future.

esp. since every phone will have to have a decoder/encoder..and there's
probably some test mode that lets it hear anything...

Here. Perhaps this will make you happy:

>
>No you did't. You post like the rankest AOL newbie.

Were you there? Do you know me? You are trying to tell me that I wasn't on Usenet 5 years ago, as if you were there the first time I was. And no, I don't post in all caps and run-on sentences like most AOL newbies. I post in complete, (usually) grammatically correct sentences.

>That's hardly an excuse. There's always Deja News, and the whole story
>had been quoted several times by the time you re-quoted it. Your
>"problem" can easily be addressed by judicious editing and intermixed
>quotes, which is standard UseNet procedure.

It wasn't meant as an excuse, just an explanation.

>You know me now. I'm the guy trying to teach you a bit of Netiquette
>that you should have learned 5 years ago.

Well, I guess you should review the part of Netiquette that speaks of "courtesy and respect to others". Especially when trying to "help" someone realize their errors.

>Don't send me unsolicited mail.

I'm not sending you anything; I politely invited you to continue this inane conversation elsewhere, so as not to be in other posters' hair. I won't mail you unless you mail me first.

>If it's off-topic, why did you address it in the first place?

Why did you?

>glenq@cyberhighway.net
>WB7DOW
>
>http://www.cyberhighway.net/~glenq/

Perhaps I should clarify something: Since I post my comments at the beginning of a reply instead of at the end, you don't have to scroll all the way past the junk to get to my text. Again, if I feel that the junk is too much, I will snip it, but so far I haven't posted more than a 3k message, and if your internet connection is so slow that you have to wait more than a second for such a small post to download, perhaps you should upgrade. Or, hell, maybe I should downgrade ;-) I'm truly sorry that my posting methods bother you; in the future, whenever I reply to you, I will post as I did in

this message. You are the only person who has ever given me a hard time
about this. If it is one of your pet peeves, again I apologize.

The only scrambling that I know of on 46/49MHZ phones is voice
inversion. If you consider voice inversion encrypted your fooling
yourself. This can be decoded with a Ramsey SS-70 for $35 or a sound
card and the free software at this site.

http://www.lpcom.com/download.html

I have a 900MHZ Digital DSS Uniden EXP9100 that cannot be found with
my scanners let alone decoded. If I open the squelch and manually
steep search until I find it, all I hear is buzzing.

A couple of years ago I was listening to a very long and complicated
chase in my area. It started out as a bank robbery. During the chase an
Officer was shot and killed by the bank robbers. I remember a feeling of
horror when I heard it. It was very upsetting.

Tune to any UNused AM broadcast frequency, and you'll hear the lightning
at the same time you see it, and hear it later when the sound gets to you.

unless of course it hits you, and then you probably won't hear anything,
and probably won't care anyway.

You can hear it on an AM broadcast radio. I noticed in this months issue of Popular Mechanics Magazine there is a note about how you can view the RF created by the lightning that is formed inside of a tornado on television channel 2.

Ha! Ha!
She's in for a BIG suprise now, California has a new law in place
that makes her the states newest penal colony resident! At least now
she won't be out endangering innocent peoples lives for quite awhile
and she will be able to use all her free time to get her head on
straight without the distractions of stolen cars, nosy cops and drugs.
My only regret with the situation now is the lack of pursuits on the

scanner these days.But,with the trade-off being that innocent people
are spared the reckless and dangerous actions of knuckleheads that
decide to run, so be it.

According to the news the next day, the suspect had a lengthy rap
sheet, was wanted for more crimes, and was possibly on his 3rd strike
here in California, which would mean a long jail sentence. He probably
was willing to go to any length to avoid going back to jail.

Keep in mind that that is a theoretical spec and not likely in
"real life". You might be able to get 70-80 out of it (which is
still good tho).

> and you can search at 100/300 steps/second.

Same here.

> The receiver is also excellent

I'll have to disagree here. I don't use my BC3000 for mil air monitoring
because I get more cell images than real mil comms.

I'll have to open my AOR 1000 up to check because I thought I tapped off pin
9 of the TA7761, which is pin for pin the same as the Motorola MC 3361.

Mike

everything is going digital. the days of analog will eventually be over. Is that so hard to admit? trunking will eventually overtake 800mhz...it has started in some cities and there is no sign that it will stop. People want more clarity and businesses want more organization. you can't stop technological advances. denial won't keep scanners around any longer. look at the ham radio being overtaken by the net. why go through all the training with the the tease of hopefully getting hold of someone in a distance land when one can chat with someone on the otherside of the world with complete clarity by computer. It's time to look ahead and quit clinging to the past.

>programs that use or impliment strong crypto.....

I think that is an export control issue, not a capability issue (don't underestimate the Defense Intelligence Agency). U.S.A. needs strong export inspection laws, because U.S. technology is dangerously advanced. Can you imagine free export laws ???? Every common terrorist in every country would be using the latest high-tech software and weapons (they're getting it in low quantities through the black markets anyway); without export control, U.S. would become the high-tech supplier of death. U.S. export laws are to protect U.S. citizens from getting targetted with their own products.

On an extremely smaller scale level, you could say that countries importing cellular-capable scanners into the U.S. are guilty of nurturing "anti-cellular-scanning" crimes, along the same lines. I know cell scanning is no big deal, but it's still illegal, and companies that import cell-capable scanners into the U.S. know this, too. Can you imagine free-import laws ??? Everyone in this newsgroup would own cell-capable scanner (unless you're like me, who really could give a rat's ass about people's phone conversations).

Yes that is true it is against the law to monitor cellular
communications. If this law is passed how is the government going to enforce
it by prying more and more into everyones private life ? Our society is
preoccupied with legislating absolute nonsense at the expense of personal
freedom . People who endorse this and similar feel good legislation shoud go
and live in a nursing home as this is the kind of life they promote - total
lack of personal responsibility at the expense of personal freedom.
The persons who sponsor this are not smart enough to figure out that the
persons they need to be worried about will not be affected by this
legislation at all. All this does is represent the interests of big business
and big government against every single individual in the United States.
People do you actually think that legislation is written with your best
interest as citizens or merely to give government more and more power.

This text file contains information for restoring coverage of US Cellular Phone
frequencies (and in some cases other information as well) for each of the
following common Radio Shack and Bearcat / Uniden scanners:

Radio Shack

PRO 34
PRO 37
PRO 39
PRO 43 (improved audio)
PRO 46
PRO 2004 (add 100 more channels, s meter, unsquelch light)
PRO 2005
PRO 2006 (keyboard beep delete or attenuate)
PRO 2022
PRO 2026
PRO 2027
PRO 2030

Bearcat / Uniden

BC 200 XLT
BC 205 XLT
BC 760 XLT
BC 855 XLT (add 50 more channels)
BC 950 XLT
BC 2500 XLT

PRO 34

REALISTIC PRO34 MODS & INFO

"NOVICE NOTES" FOR PRO-34 MODIFICATIONS

1. Remove the 4 small phillips scres on the back of the unit

2. Remove the batter cover and battery holder from the case.

3. Remove the two knobs on the top of the case (Volume & Squelch)

4. The Case has some pressure fit points, These are at the bottom of
the case and you need to be a bit careful in forcing the two halves
of the case shell appart. Once you have the pressure fit points
at the bottom released, angle up the bottom of the case until
the battery sepperation wall is clear of the internal metal frame, and
slide towards the top of the unit, place the back half of the shell aside.

5. Now you will see the RF boad mounted to the metal support frame, The
BNC (antenna) conector leads and the volume control power switch leads
are soldered directly to the board. Carefully desolder these 4 connections.

6. At the bottom of the RF board there is a IF Can transformer that has a small
wire as a groundign strap soldered directly to it. Desolder this as well.

7. There will be some wires from the volume controle knob to the PC board that
are socketed. Remove the plug from the ~F board (needle nose pliers work)

8. There will also be a similar wire (small sheilded) from the squelch control
to the RF board wich is also Socketed. Remove the plug from the RF board.
(Again Needle Nose Pliers work good here)

9. Remove the 4 thredded stand-offs from the RF Board (these Hold the RF board
to the internal mettal frame and are where the screws that hold the back of
the case on go.) Use a nut driver or Needle Nose Pliers.

10. Now there the RF board is mostly free. The only thing holding it in is the
row of connector pins on its botom side that plug into the logic board. You
will need to pry this board up gently. Be warned that the bottom side of the
RF board is just chock full of Very Small surface mounted omponents. So use
something non-metalic and smooth to do the prying with.

11. Now that you have removed the RF board, place it along with the case shell
back

12. The Internal Metal support frame is now exposed. there are 3 small phillips
screws holding the mettal frame to the bottom Logic board (actually, these
screws go through the logic board and into the front half of the case.)
2 of the screws are near the top, and 1 is at the bottom of the metal frame.
remove these 3 screws.

13. There is a small socketed wire that leads from the small power pc board on
the metal frame that goes under it and is pluged into the Logic board. Lift
the metal frame up and remove the power plug from the PC board. Place the
metal frame with|the rest of your parts pile.

14. You are have the component side of the Logig board exposed now. There are 2 small phillips screws at the bottom of the PC board (where the Battery compartment WAS) Remove them.

15. Once you have the the last 2 screw removed the Logic board is free. The speaker wires lead from the speaker to the logic board on the bottom side. These are soldered in but there is enough play in them to allow you to make the mods.

16. NOTE: The keyboard lock switch is a funky little piece of plastic with a sliding stainless metal contactor that is just wedged inbetween the front case and the logic board. Remove both the switch contacts and the plastic switch. (best know it now or loose them in the carpet)

17. On the component side of the PC board you will see lots of nifty surface mounted compone~ts, a fat little barrel capacitor (used for maintaining the channel freqs while you change the batteries.. and make modifications :) near the edge of the PC board you will see a couple of small diodes moutned vertically. These will be labeled on the PC board as D10 and D11, you will also see a place for another diaode to be soldered in but was not installed at the factory.. this is D9.

18. You must now move diode D11 to the place where D9 is labled. As you have probably noticed by now there is a tin cover over about 1/2rd of the PC boards solder side. The edge of the tin cover nearest the diodes has 2 metal tabs soldered to the P board. Desolder these 2 tabs and gently bend the metal cover way from the soder side of the PC board. This will expose the board enough to let you get your soldering iron in to where the diode leads are.

19. Desolder the D11 diode from the bottom while pulling it away from the board on the top of the board using neadle nose pliers on the LEAD only.

20. Now heat up the D9 solder pads and insert the diode (the same way it was oriented in the D11 location)

You Have Completed the Mods for complete 800mhz band coverage and 66-88mhz band coverage.

****

Subject: Eliminating a birdie in the PRO-34 portable scanner
by Bob Parnass, AJ9S

Birdies are unwanted signals generated within a receiver, which cause the receiver to "hear itself." Some birdies are caused by the unwanted product of the local oscillator. Another cause is a stage, which oscillates but isn't meant to oscillate, such as a high gain intermediate frequency (IF) amplifier.

Most birdies, especially those generated by a local oscillator, are frequency stable. It's difficult to rid a radio of these birdies, and solutions usually involve better internal shielding and isolation among the stages.

A "wandering birdie" is one which changes frequency. Wandering birdies, and birdies which appear and disappear suddenly, may be caused by intermittent ground connections within the radio, or defective bypass capacitors.

After using his Radio ShackO PRO-34 portable scanner for a few months, Ron Smithberg, a radio hobbyist in Joliet, was hampered by a "wandering birdie." Ron's scanner was hearing itself on a few frequencies in the VHF-Hi range, but the birdie disappeared when he tilted the radio or squeezed the case. There had been no problem when the scanner was purchased initially.

I suggested that a ground connection or a circuit board in his PRO-34 might be loose. The thin PRO-34 plastic case feels chintzy, and can flex easily by applying just a gentle squeeze. After prolonged use, the case motion can loosen screws which were once tight.

Ron disassembled his PRO-34. He unfastened the helical antenna, knobs, and rear screws, then gingerly removed the plastic case. After Ron tightened a Phillips screw holding the Logic Board to the front of the case, the birdie disappeared forever!

The operation took a steady hand. Although he didn't have to remove any boards, Ron warned that accessing the offending screw was a challenge. He used a very small Phillips screwdriver, positioned through a hole in a shield partition.

****

Restoration of Cellular Frequency Coverage on
Radio Shack PRO-34 Handheld Scanner

1. Remove battery cover and battery, four black screws on rear cover, and volume and squelch knobs.

2. Remove rear cover, lifting back and up to clear controls. Do not remove belt clip or circuit board screws.

3. Unplug the brown volume control connector (grn/yel/blk) and white squelch control connector (wht/blk/red) from the linear circuit board.

4. Unsolder the ground lead from T111 (at corner of linear circuit board above the external power connectors). Unsolder the two power switch leads from the back of the volume control. Unsolder the antenna connector center pin and ground wires from the linear circuit board.

5. Unscrew the four combination screws that hold the linear circuit board and received the back cover screws. Grasp the linear board at the top and lift it straight away from the front case, unplugging the 16-pin connector.

6. Remove the three screws holding the metal frame assembly which held the linear board to the front panel. Unplug the red-black power lead and lay the frame aside. It is still connected to the battery contacts.

7. Locate diodes D9 - D12 on the volume control side of the of the logic circuit board under T1; D10 and D11 are marked. Clip one lead of D11, separating the gap. This may be resoldered later if desired.

8. Reassemble the board by reversing the disassembly procedures above.

pro34.14

Date: 4 Apr 89 14:24:01 GMT
Subject: PRO-34 Scanner Modifications

In the May 1989 edition of Popular Communications is a "Letter to the Editor" on the Radio Shack PRO-34 Scanner. Below is the text of that letter.

PRO-34 Scanner Modification

In regard to the information presented (March Issue) on the handheld Radio Shack PRO-34 scanner, my own observations on the modifications have been:

1. To restore missing 800 MHz frequencies, remove D-11.

2. To add 66 to 88 MHz (European Coverage), install a diode at D-9.

3. D-10 must remain in place for full 800 MHz coverage.

4. If a diode is added at D-13 it cuts out aero band, also seems to affect 800 MHz channel spacing.

5. D-12 added dosen't seem to have any affect.

6. Only D-10 and D-11 are factory installed.

PRO 37

From: mb@sparrms.ists.ca (Mike Bell)
Newsgroups: rec.radio.shortwave
Subject: PRO-37 Scanner Modifications (Long)
Message-ID: <1991Sep24.133211.10245@sparrms.ists.ca>

Organization: Spar Aerospace Ltd, Toronto, Canada
Lines: 143

MODIFICATIONS FOR THE PRO-37

The disassembly instructions are based on the excellent PRO-34 instructions provided by Chris Scholefield (chriss@mid.com).

First of all, what modifications are possible?

The PRO-37 uses a diode array to tell its microprocessor what model it is, and thus which frequency bands to allow and what channel spacing to use. European and Australian models have full 800 MHz cover age (at an unknown channel spacing) and

a VHF-Mid band (68-88 MHz) rather than a VHF-Low band (30-54 MHz).

The Canadian and US models differ in the amount of care taken to reduce EMI. The Canadian model has additional screening, and one or two other minor component additions to achieve this. Therefore, if you have the choice, the Canadian model is preferable to the US model.

VHF-Low to VHF-Mid

Changing from VHF-Low to VHF-Mid band coverage (changing from US / Canadian 30-54 MHx coverage to European 68-88 MHz coverage) requires many component value changes (and realignment of the appropriate RF stage). Given that the PRO-37 uses SMT technology, it's not worth trying. (You can change the diode array easily enough, but just don't expect reasonable performance!)

Restoring Cellular Phone Coverage

The only sensible (straightforward) modification is the restoration of full 800 MHz coverage on Canadian and US models. The ranges restored appear with a 30kHz channel spacing -which just happens to coincide with the N. American cellular telephone channel spacing. A remarkable coincidence. The modification described is therefore applicable ONLY to Canadian and US models. (European and Australian readers could always remove 800 MHz coverage if they wished :-) .

You will need:

Soldering iron -with a fine point.
(The components desoldered and soldered are not SMT, but ....)

Desoldering tool - to remove excess solder

Philips screwdriver - if it fits the screws on the back of the case it's the right size.
Small pliers -bending component leads while unsoldering and removing hexagonal posts

Earthing wrist strap - strongly advisable with CMOS components. (Static can cause premature, if not immediate failure of components). Wear this at all times.

Small screwdriver -for prying components etc.

Experience and confidence in working with modern electronics

A couple of hours without interruptions ...

Instructions
---
0. READ THROUGH ALL OF THESE INSTRUCTIONS BEFORE STARTING!
1. Remove the battery
2. Remove the antenna
3. Pull to remove squelch and volume knobs
4. Unscrew the 4 screw on the back of the case
5. Separate the case beginning at the battery end and work over the circuit

board and knobs at the top
6. Unsolder both connections to the antenna -ground can be bent away and the centre has a l ink to the board
7. Unsolder the two power switch links at the board end
8. Unsolder the ground connections to the metal shield
9. Disconnect the two connectors to the squelch and volume controls
10. Remove 4 hexagonal posts
11. The top board may now be removed by separating it gently from the connector on the adjacent board
12. Remove 3 screws holding the shield in place
13. Lift the shield to separate it from the lower control circuit board
14. Identify diodes D12,D13 on the control board
15. EITHER cut the diode D13 and SKIP to reassembly
OR continue to desolder diode
16. Remove last two screws and remove control board. Take care not to dislocate the KEY LOCK switch when doing this.
17. Unsolder screening from side of control board near diode array,
and bend back out of way.
18. Unsolder and remove diode D13. Keep it somewhere so that you can replace it if required to do so by US legislation.

Reassembly is the reverse of the above procedure. If you performed steps 16-18 CHECK REALLY CAREFULLY that the metal part ofthe KEY LOCK switch is in the right location. (Otherwise, you may find yourself having to disassemble the whole thing again - I know, I did!)

NOTES.
1. One must exercise great caution in the procedure. Check that no flakes of solder get dropped on the boards. Take anti-static precautions by doing the work on a mat and wearing a wrist strap. Do not make any adjustments to the upper analogue board or bend any of the other wire links on it, which are tuned circuits.

2. Another caution is that doing any of the work will probably violate any warranty you may have on the scanner. Might be worth burning the scanner in for ~150 hrs before attempting this to reduce the risk of a latent component fault appearing after you have made the modification.

3. YOU PERFORM THE ABOVE PROCEDURE ENTIRELY AT YOUR OWN RISK. You may wish to obtain a copy of the PRO-37 Service Manual from Radio Shack before attempting this. (Cost about $20 - well written - just wish I could afford all the service gear required!)

4. If you happen to find out what adding D14 does (another difference between N. American and European/Australian versions), I'd be interested to know. It's not mentioned in the service manual. I think it could affect 800 MHz channel spacing - any info on the European / Australian PRO-37 specs in this area would be appreciated.

5. If you found something wrong in the above instructions, let me know and I will try and post an update.

6. If you found all this helpful, help someone else and donate $5.00 *today* to your favourite charity. Share and Enjoy!

== PRO-37

This works. I have used this procedure to modify my pro37. One note:there is no reason the remove the logic board. If you have skinny wirecutters, you can easily get to the correct diode. This will save youthe trouble of getting the key pad and key lock back together properly. Restoring the full 800Mhz coverage of the RS Pro-37 scanner. The following notes have been shamelessly plagiarized from Mark Miller'sexcellent instructions on modifying the Pro-34. The two scanners arephysically so similar that I needed to make only a few minor changesin Mark's notes to make them fit the Pro-37.

The instructions below are for those that don't like to completely dissassemble every new electronic toy they buy just to see how it works. Nor is it for the guy that has been building their own equipment since the days of the first tube diode. This set of instructions assumes a moderate level of skill with a soldering iron, and some simple hand tools. It is aimed at those who just want the additional coverage from the mods but havn't been building kits for a decade.

"NOVICE NOTES" FOR PRO-37 MODIFICATIONS

1. Remove the 4 small phillips screws on the back of the unit
2. Remove the battery cover and battery holder from the case. You won't loose your programming as long as you don't take all day to do this.
3. Remove the two knobs on the top of the case (Volume & Squelch)
4. The case snaps together at the bottom via two molded "hooks" in the back half of the case which fit into two indentations in the front half. These can be snapped apart by applying the right leverage to bend the hooks a way from the indentations that they fit into while pulling the case apart. You'll see what I mean when you look at it. You need to be a bit careful in forcing the two halves of the case shell apart. Once you have the snaps at the bottom released, angle up the bottom of the case until the battery separation wall is clear of the internal metal frame, and slide towards the top of the unit. Place the back half of the shell aside.
5. Now you will see the RF board mounted to the metal support frame. The BNC (antenna) conector leads and the volume control power switch leads are soldered directly to the board.

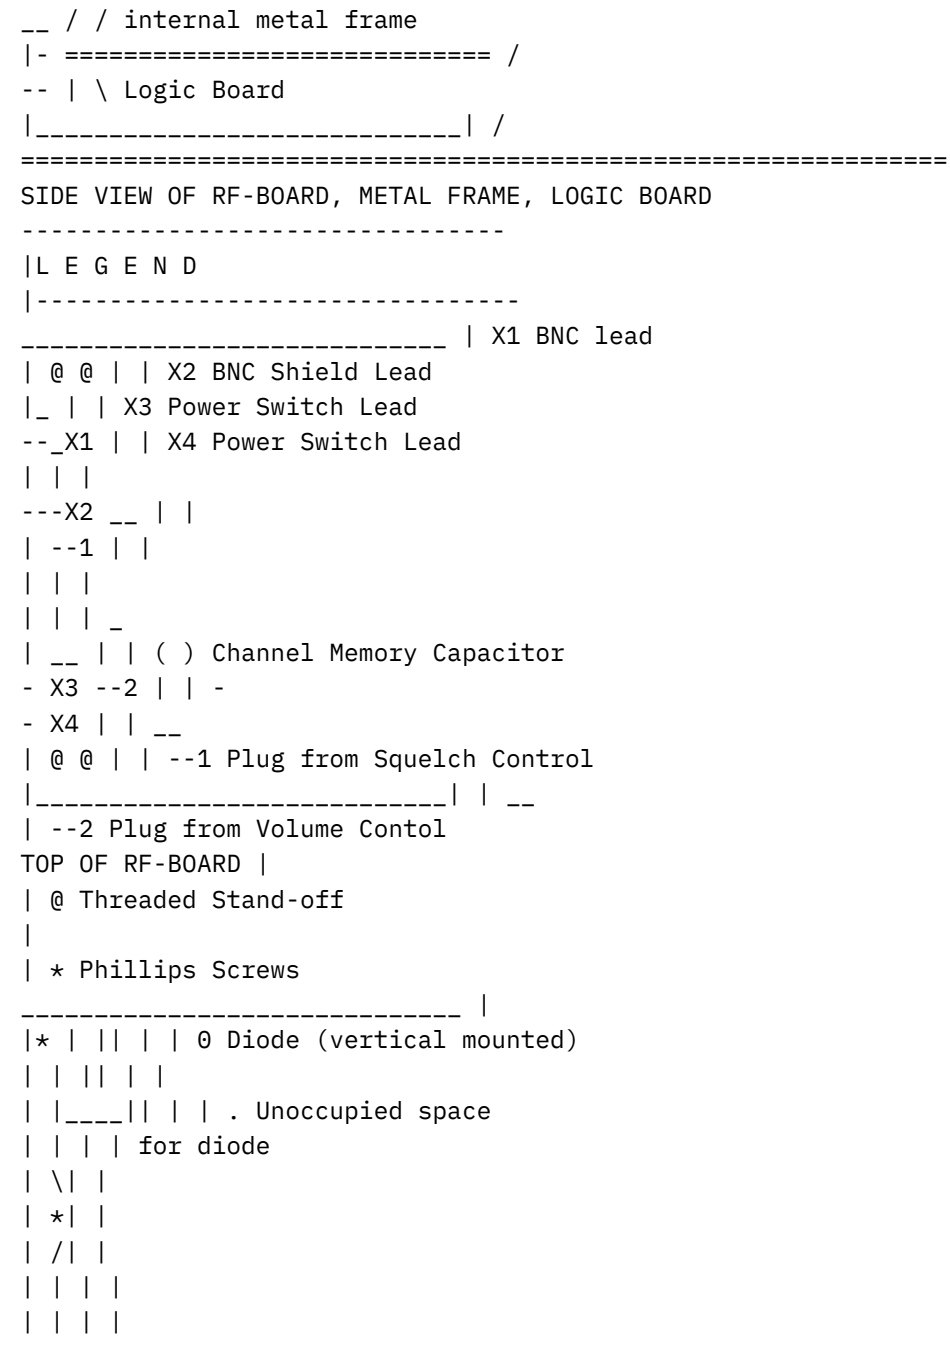
6. Carefully desolder these 4 connections.
7. There will be a wire from the volume control knob to the PC board
that is plugged in. Remove the plug from the RF board (needle nose pliers
work)
8. There will also be a similar wire (small shielded) from the squelch control
to the RF board wich is also plugged in. Remove the plug from the RF board.
(Again Needle Nose Pliers work good here)
9. Remove the 4 threaded hex stand-offs from the RF Board (these hold the RF
board to the internal metal frame AND are where the screws that hold the
back of the case screw in) Use a nut driver or Needle Nose Pliers.
10. Now the RF board is mostly free. The only thing holding it in is the row of
connector pins on its botom side that plug into the logic board. You will
need to pry this board up gently. Be warned that the bottom side of the RF
board is just chock full of Very Small surface mounted components. So use
something non-metalic and smooth to do the prying with.
11. Set the RF board aside.
12. The Internal Metal support frame is now exposed. There are 3 small phillips
screws holding the metal frame to the bottom Logic board (actually, these
screws go through the logic board and into the front half of the case) 2 of
the screws are near the top, and 1 is at the bottom of the metal frame.
Remove these 3 screws.
13. There is a small socketed wire that leads from the small power pc board on
the metal frame that goes under it and is plugged into the Logic board.
Lift the metal frame up and remove the power plug from the PC board.
Place the metal frame with the rest of your parts pile.
14. You have the component side of the Logic board exposed now. There are 2
small phillips screws at the bottom of the PC board (where the Battery
compartment WAS) Remove them.
15. Once you have the the last 2 screws removed the Logic board is free. The
speaker wires lead from the speaker to the logic board on the bottom side.
These are soldered in but there is enough play in them to allow you to make
the mods.
16. NOTE: The keyboard lock switch is a funky little piece of plastic with a
sliding stainless metal contactor that is just wedged in between the front
case and the logic board. Remove both the switch contacts and the plastic
switch. (best know it now or loose them in the carpet)
ALSO: don't touch the innards of the keyboard itself, which will now be
exposed. It appears that the keys make direct contact with pads on the
circuit board, and you don't want grit and skin oil to be getting in there.

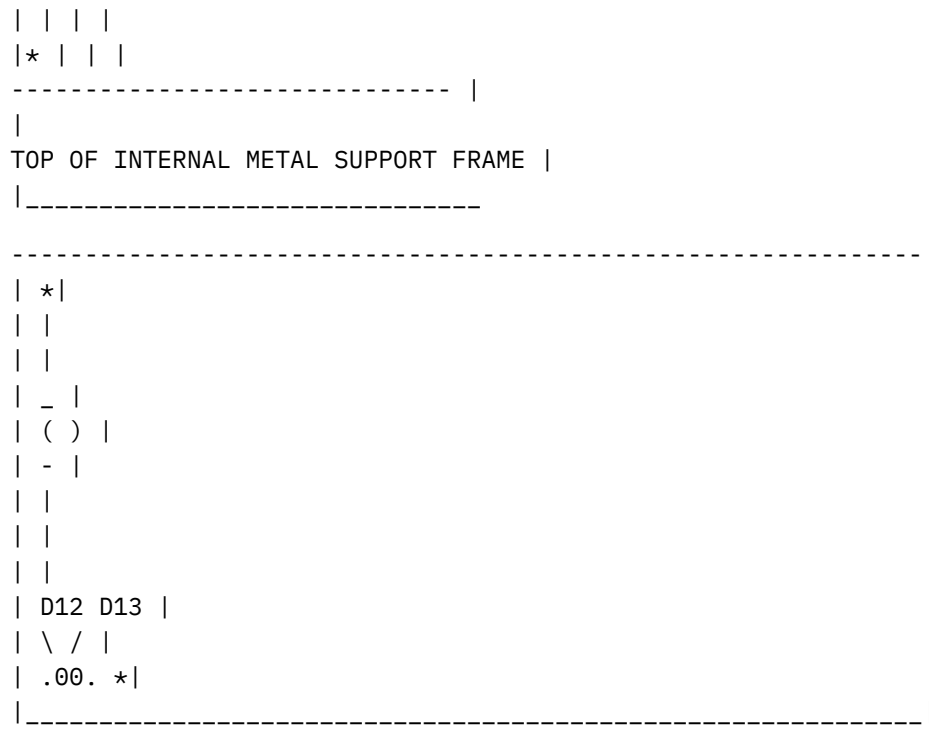
17. On the component side of the PC board you will see lots of nifty surface
mounted components, a box-like capacitor (used for maintaining the channel
freqs while you change the batteries.. and make modifications :) near the
edge of the PC board you will see a couple of small diodes mounted
vertically. These will be labeled on the PC board as D12 and D13. You will
also see places for two other diodes to be soldered in (labeled D11 and D14)
but nothing is installed in these.
18. Now carefully clip the lead coming from D13 and bend the diode away slightly
to make a gap between the resulting two pieces of wire. Clip it near the
middle to leave plenty of room to resolder, in case you ever want to undo

the mod. You have completed the mod for complete 800mhz band coverage. Follow the same steps backwards (18->1)and replace "remove" with "replace"and "desolder" with "solder" N.B. These instructions are from last night, All the steps are in correct orderas well as the general i nformation. The diagrams are from memory so componentsmay not be in the exact location indicated, but they will be very close.

LASTLY, Now that you have made the mods, you can use the warranty card to light the Bar-B-Q Grill with.

################################### DIAGRAMS ###################################





PRO 39

(from Monitoring Times, January 1993, Dial 1-800-438-8155, Great Magazine!)

Realistic (R) PRO-39 Cellular Restoration (Page 107)

[with a few comments added by someone who witnessed such restoration -jqt]

The recently released PRO-39 handheld scanner from Realistic (R) is a fine performer, but its 800 MHz range is interrupted by the factory censoring of cellular frequency coverage. Long-time MT supporter Larry Wiland of Youngstown, Ohio, would like to share the simple fix. Remember, however, that it is unlawful to listen to cellular phone calls.

(NOTE: These procedures may void your warranty. Do not attempt them unless you are familiar with small component soldering. Monitoring Times accepts no responsibility for damages resulting from attempting this modification.)

TOOLS NEEDED: Fine-tipped soldering iron, desoldering wick, small Philips screwdriver, long-nosed pliers, rosin-core solder.

(1) [Turn off your radio. Removing the batteries when the radio is ON can erase the memory! -jqt] Remove the battery door, holder and [battery pack] from the bottom of the radio.

(2) Remove the four screws from the back of the scanner and carefully lift
the back off.

(3) Unplug the two wiring harnesses at their connectors and remove the six bright
colored screws [that hold] the circuit board in place. Unsolder
the ground wire from the lower right corner of the circuit board.
Unsolder the two wire connections from the BNC antenna connector at the
board. Carefully lift the board (grasping it near the Molex connector)
and set it aside.

(4) Remove the two bright colored screws from the next circuit board.
Carefully unplug the two-wire connector [and remove the board, as I
recall -jqt]. Unsolder and lift the rectangular metal shield exposing
the diodes.

(5) Carefully unsolder and remove diode D6 only; this will restore the
missing cellular frequencies which can be searched in appropriate
30 kHz steps.

This completes the cellular restoration. Reverse all procedures
to reassemble the radio and test it by entering any frequency between 869-894
MHz. [If you are as lucky as I was, the memory will still
contain your other frequencies! -jqt]

Curious about the other diodes? D4 would enable 68-88 MHz
coverage, but deletes 30-54 MHz; D5 (present) allows 800 MHz band
operation; and D7 would make cellular spacing 12.5 kHz (incorrect).

Thanks Larry!

PRO 43

This file is meant to replace the old PRO-43 mod file.

From: armille@afterlife.ncsc.mil (A. Ray Miller)

Summary: cellular (870-890 MHz) and low band (51-88 MHz) restoration for
PRO-43A few people have mentioned the cellular mod for the PRO-43 ; it turns out
you should not remove but MOVE the diode. Doing so allows cellular coverage as
well as low band (up to 88 MHz) coverage. Acknowledgments to Grove Enterprises;
this information came from them. They are selling the PRO-43 for $300 which is
$50 less than Radio Shack. I have no connection with them other than as a
satisfied customer.

PRO-43 Cellular Frequency Restoration and Low Band Expansion

Note: It is not lawful to monitor cellular or conventional mobile telephone
conversations. The following procedure requires familiarity with microcircuit
soldering andwill violate your warranty. Grove Enterprises assumes no liability
resultingfrom its attempt, nor will accept the modified scanner for return under
anycondition.

TOOLS NEEDED: Fine point, low power soldering pencil; solder wick or adesoldering
tool; pointed awl, hemostats or pointed tweezers; small Philipsscrewdriver;

solder.

1) Remove the battery, antenna and back cover (held in place by four screws).

2) Remove the six screws holding the top circuit board in place. Carefully unsolder the two antenna connections from the board. Bend the antenna groundtab fully up from the board. Carefully lift the board, unplugging the blackconnector at its base, and lay the board out of the way on its bundle of colored wires.

3) Remove the two screws from the next board and lift it, carefully unplugging the white connector at the bottom of the board. Lift it up and lay it aside on its brown wire (which can be unplugged if necessary).

4) Unsolder and remove the metal shield from the final board, revealing the microprocessor; note the row of diodes labeled D1-D5 above it. Only diodes D1, D2, and D4 are present; assisted by a pointed tool, unsolder and remove D4,the lone diode (this restores cellular frequencies which will be searched in 30kHz steps).

5) Resolder the removed diode carefully into position D3 to extend low bandcoverage to 88 MHz. 6) Reassemble the boards, paying particular attention to the alignment of the plugs. Test the radio by entering any frequency between 870 and 890 MHz (cellular) and 51-88 MHz (low band).

-- A. Ray Miller

From: ross@novax.llnl.gov
Date: 19 Aug 92 16:51:08 GMT

Here is my keypad beep delete mod for the RPO-43:

1. Remove battery.

2. Remove back cover (4 screws).

3. Remove top board (6 screws, desolder two antenna connections and bend antenna ground lead up out of the way). Be careful of black connector at bottom of board. Flip board over and lay aside (wire connectors need not be disconnected).

4. Remove middle board (remove 2 screws and wire connector). Be careful of two multi-pin connectors along underside of board. Set middle board aside.

5. Locate 10 pin connector on side of bottom board (labeled CN3). Note that one end of connector has pin 10 labeled as such. Count back to pin 6 and bend pin 6 ninety degrees towards the large RF shield. Make sure the bent pin clears the RF shield.

6. Reassemble and your done OR do the cell mod since you are so close. Have fun.

Gary Ross >usual disclaimer>-------

Subject: Improved audio for the PRO-43 portable scanner

From: parnass@cbnewse.cb.att.com (Bob Parnass, AJ9S)
Date: Wed, 2 Dec 1992 01:15:35 GMT

IMPROVED AUDIO FOR THE PRO-43 SCANNER by Bob Parnass, AJ9S

The Radio Shack PRO-43 scanner audio is too bassy.

1 The lack of treble makes it difficult to hear the PRO-43 in noisy situations, especially while listening in a car or truck. Louis Shirley sent me a schematic and suggested I remove C341, a tiny 0.015 ufd surface mount capacitor. I'm glad to report that removing C341 made a great improvement. The audio is now much "crisper," more like the Uniden 200xlt, although still not quite as loud. Turning the volume control up still overloads the PRO-43's small, internal speaker, but there's less need to do that once C341 is removed. The PRO-43 contains 3 printed circuit boards, and the middle (second) board contains the audio circuitry. Finding C341 is difficult, as it is neither marked with a value nor a component designation. It is located on the foil side of the middle board, under IC304, an LM386 amplifier IC. C341 is in parallel with, and physically next to, R350 (33,000 ohm). R350 is slightly larger than C341 and is marked 333. Both R350 and C341 are connected between pin 2 of the LM386 and ground.

A Note About 50-88 MHz Reception Now that I have a schematic, I see that the European version of the PRO-43 has different coils and capaci-tors in the low (mid) band front end filter. That explains why the 75 MHz sensitivity isn't stellar after adding diode D3 to enable 30-88 MHz coverage.

See "PRO-43 Product Review," by Bob Parnass, AJ9S, in the November 1992 RCMA Journal.

Lines: 71

Here is what I found for the Pro-46 mod:
(same from 2 different sources)

Pro46.Mod You will be able to tune continously from 806 to
956 and this will include the appx 870 - 890 cellular band with
the proper 30 MHz steps for the cellular frequencies.

1.Remove battery pack, battery door and antenna.

2.Remove the 4 black screws on the back of the radio: push upward on bottom atrear case and cantliever (swing) case half up from bottom to separ ete andremove, its not necessary to remove belt clip.(note: This sounds much easier than it is. Be prepared to "prop and lever" around 3 catches in the battery case, along with one on each side around 1/4 of the way down the case)

3.Carefully separate RF board from processor board by inserting eye glass screwdriver between board by plug-in connector.

4.Unsolder copper-coated plastic Rf shield from microprocessor and set aside. (note: If memory serves me correctly, this SHOULD be the side where th e pushpad is. In order to follow the rest of the instructions, place the scanner face down on a piece of cloth or in a clamp with the antenna facing AWAY from you).

5.Locate two resistors marked "0" (zero) on right side of board. (note: On mine they were labeled "000", not "0")

6.Carefully unsolder and remove BOTH of the resistors.

7.Reinstall ONE of the removed resistors (or jumper) on the UPPERMOST set of EMPTY solder pads. (note: These are located just to the left of where you just removed the two resistors.)

8.Thats it, reassemble the radio.PS-Reintstall one of the removed zero marked resistors into top set of emptysolder pads. DO NOT install anything into LOWER SET of empty pads (cancels 30-50 mhz and adds 68-88 mhz.

****

The Following modification is intended only to restore continuous 806-956 MHz coverage as originally provided by the designof the PRO-46 Microprocessor.

824-851, 869-896 M Hz Freq Restoration:

Tools Required:

Fine-tipped soldering iron, desoldering wick,small Phillips screwdriver, small jeweler's type screwdriver,long-nose pliers, rosin core solder.

(1) Remove the battery pack, battery door and Antenna.

(2) Remove the four black screws from the back of the radio, then push upward on the bottom of the rear of the case, carefully swinging it upwards and removing it.

(3) Carefully insert a small (jeweler's) screwdriver between the two boards next to the interconnect plug in the lower right coner. Gently pry the top board up to sparate it and set it aside.

(4) Unsolder the copper-coated plastic shield from the microprocessor
and set it aside. CAUTION : Too much heat will damage the shield.

(5) Locate the two chip jumpers imprinted with "0" (on mine they were
imprinted with "000"), near the edge. Carefully unsolder and
remove both. Note: they are side-by-side below the microprocessor.

(6) Solder one chip jumper across the two uppermost unsed solder
pads (Closest to microprocessor). Soldering a jumper across
the lower two pads (futhurest down from microprocessor),
changes the 30-50 Mhz low band to 68-88 Mhz for foreign use.
Don't do this! The RF section is not alligned for 66-88 MHz, and
there's little worth listening to in the US and Canada on that
band, anyway. Note : Unused pads are almost straight across from
where the jumpers where origi nally installed.

(7) Reversse steps 1-4; the modification is now complete.

This DOES work. You should note that the two resistors that you
have to remove are SMALL! The only questions I had wit h this was
what they meant bysolder pads. Well, it turns out that they mean
(duh) the two spots ofsolder that do not hold anything in. And
here I was about to use thesetwo holes near the top of the board!

Anyway, good luck.--Nat Guyton

PRO 2004

The PRO-2004 scanner can be used to receive cellular telephone conversations.
Originally, the scanner was able to receive in this band, but at the last
minute, it was decided to delete cellular coverage from the PRO-2004. The
procedure to re-instate the cellular band is simple for anyone with a pair of
cutters, and a phillips screw-driver.

1. Remove the four screws from the back of the radio, and slide off the cover
from the chassis.

2. Turn the radio upside down. You will find a metal box-like sub-chassis in
the center of the main chassis. Remove the cover andyou will be looking at the
CPU, a 64-pin integrated circuit.

3. Examine the component side of this board, and you will find a row of diodes
and resistors. On one end of the row you will find a diode labeled D-513.

4. Clip the accessible end of D-513, and pry apart the ends so they don't
touch. You have just restored cellular coverage to you scanner.

5. If D-513 is not there, it may be located on the underside ofthe circuit
board.

Information was extracted from POPULAR COMMUNICATIONS Aug 1987.

****

------------------+| Modifications for the 2004 |+-----------------------

1. Remove diode from "513" to get excluded 800 MHz freqs.

2. Install a 1N914 diode in "514" to increase scan rate to 10/20 channels-per-second.

3. Install a 1N914 diode in "510" to get the extra 100 channels.

4. Remove diode from "D-44" to restore missing frequencies in the 806 to 960MHz band.

5. Remove diode from "D-45" to restore coverage from 68 to 88MHz.

In step 5 above, I have no idea what this is for. My 2004 came from the store already scanning this range, and this was the first I had ever heard of it. The same goes for step 4. When I removed D513 (as in step 1), I got those freqs back. Perhaps the user who originally posted these had a radio from a different production run. All I can "vouch" for is steps 1, 2, and 3.

File appended: more mods for the scanner
From: ewb@raybed2.UUCP (EUGENE BALINSKI)
Newsgroups: rec.ham-radio
Subject: PRO-2004 MODS HERE THEY ARE !!!
Keywords: AGAIN !
Date: 12 Jan 89 14:34:39 GMT
Organization: Raytheon Co., Bedford, Mass.

I guess it's time to post this article again. As always do these mods at your own risk. I assume no responsibility. 73 & good listening Gene WA1UXA These mods are detailed in the following articles:

a) POPULAR COMMUNICATIONS AUG 87, PP 18-20
b) MONITORING TIMES OCT 87, P 53
c) MONITORING TIMES DEC 87,P 60

I suggest strongly that you obtain the back issues and read through the letters or articles. I also suggest you subscribe to the mags. They supply a lot ofgreat info and freq lists. Now the mods.

1) Restoring 870 MHz coverage. First treat the radio as if it were CMOS, that is make sure you and it have no built up static charges. UNPLUG THE RADIO FROM THE AC OR DC POWER SOURCE AND ANTENNA !!!!!!!! Take the radio out of the case by removing the 4 screws onthe back. Carefully invert the radio. Locate a box-like sub-circuit. It's near the switch marked "restart". The sub-circuit should be marked PC-3. Carefully pry off the cover of the metal box. Inside there will be a 64 pin dipIC. This is the radio CPU. Be careful not to touch or short out any leads onthe chip. Near the chip there will be a row of diodes marked D-502 to D-515.If D-513 is p resent, cut one lead, separate it so they will not touch, and magic, 870 Mhz is restored. If D-513 is not there and you still do not have 870 coverage, then a little more work is in order. Locate the 9 pin connector "CN-

501". Carefully remove it from the sub-circuit. Unscrew the screws holding PC-3 to the main chassis. Carefully invert the sub-circuit board (PC-3). Locate the one lone component on that side of the board. If it is a diode, as it should be, then cut one lead and separate them as above. Re-install thesub-circuit with the screws on to the main chassis. Reconnect the 9 pinconnector.
Do NOT put the cover back on just yet ?!

2&3) 400 CHANNEL and SPEED MOD !

On the top of the sub-circuit board, locate the slot for D-513. Count backwards from there until you get to the space for D-510. Install a diode at D-510 in the same polarity as the rest of the diodes. There, you now have 400 channels instead of 300 ! Now install a diode at D-514 and you have increased the scan speed to 20 channels/sec from 16 ch/sec. Carefully re-assemble the metal box. Make sure everything else is as it should be. RE-invert the radio so it is right side up.

4) THE SQUELCH MOD !!
Now, locate a sub-circuit box under the sloping front panel. It should have many alignment holes in the top. Pry the cover off very carefully. Locate IC-2 in the left side of the pc board. It should be marked IC-10420. Locate R-148, a 47 K ohm resistor between pins 12 and 13. Cut a lead of this resistor, But be sure to leave enough lead on both sides of the cut to solder to. Patch in a 100K ohm resistor. Make sure there are no solder balls or short circuits. Now your squelch will operate more smoothly.

make sure you re-install the metal cover and re-install the radio in the case

I STRONGLY suggest you obtain the above mentioned magazines for more details.

73 Gene WA1UXAPS

Hicksville, NY. 11801

Monitoring Times
140 Dog Branch Rd
P.O. Box 98
Brasstown, NC. 28902

RADIO SHACK 2004 EXPANDED COVERAGE:

1. Remove the 4 philips screws on the back of the unit that hold the case onto the chassis.

2. Slide the radio out of the case by pushing it out the front. Or, put another way, slide the case back, off the radio.

3. Once you've eased the radio out, turn it upside down with the front toward you.

4. Locate a board with "PC-3" stenciled on it in big white letters. It is roughly in the middle of the radio near the back. There is a rectangular,

highly reflective (mirror-like) metal cover covering most of this board.

5. Gently remove this metal cover. It is held on by being press-fit over little metal dimples. A little careful prying will do the trick here.

6. Once the cover is off you should see the main CPU chip on the right, a resonator crystal (501-X I think?) in the rear right corner, and a vertical row of diodes to the left of the CPU chip. Some of the diode positions will be lableled like this D-509, D-510, D-511, D-512, *D-513*, etc. I don't remember exactly which ones are labled or not, but that's not so important right now, you should get the idea.

7. The diode D-513 is labled (I know) and this is the beastie that disables the cellular phone frequencies and their 30KHz search step size. Snip this diode with diagonal cutters (or whatever). Make sure the snipped wire ends are not touching, and viola! You've got full 800MHz coverage on your Pro-2004. 8. You may want to test it at this point. (Try entering 880 MHz or some other previously disabled 800MHz frequency, and verify that you don't get an ERROR.) Re-assemble.

PS: There is a TURBO-Scan mod where you can up the scan speed to around 30ch/s by replacing the resonator crystal in step 6 with a 10MHz version. Also, by soldering in a diode in what would be diode position D-510 (if it were labled) you can add 10 channels to eachbank for a total of 400 ch. The problem with this is that then the keypad's labelling for channel
banks becomes incorrect. You should get and verify the complete details on the mods in this "PS" becauseI can't supply you with complete instructions that I am 100% sureabout on these. I'm just letting you know they're possible...

A carrier operated light for the PRO-2004
[repost]
Several PRO-2004 owners have asked for a repost of this article:

A CARRIER OPERATED LIGHT FOR THE PRO-2004 SCANNER by Bob Parnass, AJ9S The July 1988 issue of Monitoring Times suggested that it may be easy to add an S-meter to the Radio ShackO PRO-2004 scanner: "...But adding an "S" meter is even easier than previ-ously thought. Pin 10 on the IF amplifier (IC1) is an "S" meter output. With the proper bridge or meter buffer/amplifier an "S" meter is reality...."

Brace yourself for disappointment - the integrated cir-cuit mentioned in the article is used for WBFM only. Despite the internal IC block diagram in the service manual, pin 10 on my PRO-2004 is useful as an S-meter output only when the radio is in the WBFM mode. Between pin 10 and ground, I placed a 10,000 ohm resistor in series with a 250 microamp meter for a simple test setup. The meter read full scale on strong signals. With no signal at all, the meter read about 70% of full scale. When the mode is set to AM or NBFM, the meter was always at zero. One could add a brie circuit here, but this metering point is of limited utility.

Add a Light Instead With a room full of functioning scanners, it's difficult to determine quickly which radio is "talking." I use separate external speakers

on each radio, and the spatial separation helps. In addition to "hearing" which radio is active, I like to "see" which radio is active, and carrier operated lights are effective at providing such visual cues. The idea is to illuminate a lamp when a signal opens the squelch. A small yellow light emitting diode (LED, another Bell Labs invention) is well suited to this purpose. The following modification works well on all PRO-2004 modes. To add a COR light to the PRO-2004, make use of the "scan control" pin (pin 13) on IC2, the TK10420 IC. Pin 13 has voltage present only when a signal is detected. This chip contains the IF, detector, limiter, and squelch circuitry for NBFM. If you tremble with an electric drill in your hands, read no further. The LED can be mounted in a small hole drilled through the plastic front panel, just to the right of the headphone jack. Electronically, the circuit is simple. The voltage at pin 13 is not enough to drive the LED directly, so a general purpose NPN transistor (e.g., a 2N2222) can be used as a solid state switch.

- Pin 13 of IC2 is connected to the transistor base through a 10,000 ohm resistor.

- The emitter is grounded.

- The collector is connected through a 1000 ohm resistor to one end of an LED. This resistor limits the LED current to about 13 milliamps.

- The other end of the LED is connected to one contact on the rear of the PRO-2004's on/off, volume control. This furnishes about 14 VDC unregulated

here a list of the diode functions as printed in
Aug 1988 edition of 73 by KB6LCN

d-510 in circut - scanner will have 400 memories (10 x 40)
not in circut - scanner will have 300 memories (10 x 30)

d-512 in circuit - it will step 30 kHz from 825-844.995 and 870-889.995
removed - " " " 12.5 " " " " "a

d-513 in circut - will not scan 825-844.995 MHz or 870-889.995 MHz
removed - will scan all of 800 MHz band

d-514 in circuit - scanning rate increases to 20 channels per second
not in circut - scanning rate in 19 ch/sec (alt 8 ch/sec)

!!!! WATCH POLARITY !!!!

in Aug 1987 Popular Communications Bill Cheek gives the bet details to bring back the lost 800 MHz Freqs. and poinsts out that in the replaced bands the defalt skip rate for a search is 30 MHz however if change it with the step key you need to press the RESET key on the front keypad to return to 30 MHz increment step. (RESET is to to be confused with the RESTART button on the rear of the unit).

he also gives modifications for an S-meter

S-METER

1 - locate transister q-9 (far frount right area of the radio, just
under the sloaping front panel.

2 - drill a 1/4" hole in the rear chassis of the radio

3 - install a RCA jack in this hole

4 - Install on lead of a .10-uF ceramic disc capacitor to the center
lug of the RCA jack and the other lead to ground lug of the RCA
jack

5 - clip off all but 1/4" of leads of a 10-K ohm resistor. Carefully,
soder one lead to the collector (center lead) of q-9.
!!! pretin all leads and use a low watt iron with sharp tip

6 - solder a 12" wire to the free end of the 10-K resistor. Slip a 1"
section of insulated tubing over resistor and wire to prevent
shorting.

7 - connect free end of the wire to the center lug of the RCA jack

8 - connect a voltmeter capable of reading between 1 and 3 volts,
DC (digital or analog to a RCA plug. red wire to center, and
black wire to the shell. shielding in not needed.

connecting the rca jack and plug will now give you a measurement
of the recievers intermediate frequency automatic gain control (IF AGC)
the auther said the the range will be between + 1.87 volts DC with
no signals present to +2.6 volts DC for a strong signal. he also
suggested that a digital voltmeter with 2 or three decimal places
gave better resolution.

If any else knows mods let us know.

by Gene WA1UXA

In response to numerous inquiries I am posting a short overview of the
mods to the Radio Shack PRO-2004 scanner. First, all mods are done at
your own risk. I assume no responsibility. I do not know what effect they
(the mods) will have on any warranty, however I would think they would
probably void it. Also, one of the mods restores coverage of the cellular
phone frequencies. It is ILLEGAL TO LISTEN TO CONVERSATIONS IN THIS BAND !
^^
Therefore my supplying info to you does NOT in any way constitute an invitation
to break the law. You are on your own!

These mods are detailed in the following articles:
a) POPULAR COMMUNICATIONS AUG 87, PP 18-20
b) MONITORING TIMES OCT 87, P 53
c) MONITORING TIMES DEC 87,P 60
I suggest strongly that you obtain the back issues and read through the letters
or articles. I also suggest you subscribe to the mags. They supply a lot of great
info and freq lists. Now the mods.

1) Restoring 870 MHz coverage.
First treat the radio as if it were CMOS, that is make sure you and it have no built up static charges. UNPLUG THE RADIO FROM THE AC OR DC POWER SOURCE AND ANTENNA !!!!!!!! Take the radio out of the case by removing the 4 screws on the back. Carefully invert the radio. Locate a box-like sub-circuit. It's near the switch marked "restart". The sub-circuit should be marked PC-3. Carefully pry off the cover of the metal box. Inside there will be a 64 pin dip IC. This is the radio CPU. Be careful not to touch or short out any leads on the chip. Near the chip there will be a row of diodes marked D-502 to D-515. If D-513 is present, cut one lead, separate it so they will not touch, and magic, 870 Mhz is restored. If D-513 is not there and you still do not have 870 coverage, then a little more work is in order. Locate the 9 pin connector "CN-501". Carefully remove it from the sub-circuit. Unscrew the screws holding PC-3 to the main chassis. Carefully invert the sub-circuit board (PC-3). Locate the one lone component on that side of the board. If it is a diode, as it should be, then cut one lead and separate them as above. Re-install the sub-circuit with the screws on to the main chassis. Reconnect the 9 pin connector. Do NOT put the cover back on just yet ?!

2&3) 400 CHANNEL and SPEED MOD !
On the top of the sub-circuit board, locate the slot for D-513. Count backwards from there until you get to the space for D-510. Install a diode at D-510 in the same polarity as the rest of the diodes. There, you now have 400 channels instead of 300 ! Now install a diode at D-514 and you have increased the scan speed to 20 channels/sec from 16 ch/sec. Carefully re-assemble the metal box. Make sure everything else is as it should be. RE-invert the radio so it is right side up.

4) THE SQUELCH MOD !!
Now, locate a sub-circuit box under the sloping front panel. It should have many alignment holes in the top. Pry the cover off very carefully. Locate IC-2 in the left side of the pc board. It should be marked IC-10420. Locate R-148, a 47 K ohm resistor between pins 12 and 13. Cut a lead of this resistor, But be sure to leave enough lead on both sides of the cut to solder to. Patch in a 100K ohm resistor. Make sure there are no solder balls or short circuits. Now your squelch will operate more smoothly.

Again, I STRONGLY suggest you obtain the above mentioned magazines for more details. Addresses appear below. Please ignore any mis-spellings, mis grammer, etc. Good luck and good listening !!!

PS, make sure you re-install the metal cover and re-install the radio in the case !!!!!!!!!!!!!!!!

PRO 2004 Cellular Restoration Mod (Novice Instructions):

1. Remove the 4 philips screws on the back of the unit that
hold the case onto the chassis.

2. Slide the radio out of the case by pushing it out the front.
Or, put another way, slide the case back, off the radio.

3. Once you've eased the radio out, turn it upside down with the
front toward you.

4. Locate a board with "PC-3" stenciled on it in big white letters.
It is roughly in the middle of the radio near the back.
There is a rectangular, highly reflective (mirror-like) metal
cover covering most of this board.

5. Gently remove this metal cover. It is held on by being press-fit
over little metal dimples. A little careful prying will do the
trick here.

6. Once the cover is off you should see the main CPU chip on the
right, a resonator crystal (501-X I think?) in the rear right
corner, and a vertical row of diodes to the left of the CPU chip.
Some of diode positions will be lableled like this D-509, D-510,
D-511, D-512, *D-513*, etc. I don't remember exactly which ones
are labled or not, but that's not so important right now, you
should get the idea.

7. The diode D-513 is labled (I know) and this is the beastie that
disables the cellular phone frequencies and their 30KHz search
step size. Snip this diode with diagonal cutters (or whatever).
Make sure the snipped wire ends are not touching, and viola!
You've got full 800MHz coverage on your Pro-2004.

8. You may want to test it at this point. (Try entering 880 MHz or
some other previously disabled 800MHz frequency, and verify that
you don't get an ERROR.) Re-assemble.

PS: There is a TURBO-Scan mod where you can up the scan speed to
around 30ch/s by replacing the resonator crystal in step 6 with a
10MHz version. Also, by soldering in a diode in what would be diode
position D-510 (if it were labled) you can add 10 channels to each
bank for a total of 400 ch. The problem with this is that then the
keypad's labelling for channel banks becomes incorrect. You should
get and verify the complete details on the mods in this "PS" because
I can't supply you with complete instructions that I am 100% sure
about on these. I'm just letting you know they're possible...

] Turbo scan for the 2004 ??? Yes !! Someone has realized that if you
] replace the present 7.37 MHz ceramic resonator CX501, with a 10.7 MHz
] ceramic resonator it really boosts the scan/search speed! The present
] resonator is soldered between pins 29 and 30 of the CPU (IC-503).
] Rumor has it that a 10.00 MHz computer xtal will work just fine.
] Note: The effect of the speed mod on weak signal performance is

] presently unknown.

The resonator is for the CPU clock oscillator. Jacque KA9FJS confirms that the mod works with an ordinary 10 MHz computer crystal ($1 at hamfest) but reports a possibly-undesirable side effect: Increasing the clock rate _decreases_ the resume-scan delay time. Jacque says: "The manual says delay is 2 seconds; with mod, delay is <1 second. Painful if a channel is filled with slow responders." He reports no detection problems at the increased scan rate.

>Also, by soldering a diode in... position D-510 (if it were labled)
>you can add 10 channels to each bank for a total of 400 ch. The
>problem with this is that then the keypad's labelling for channel
>banks becomes incorrect...

PRO 2005

PRO 2005 Mods

Date: 30 Jan 90 10:22:00 GMT
Subject: 2004/2005 modifications

>Can someone please post the mods for the PRO-2004 & PRO-2005 for continuous coverage through the 800 Mhz band, increased scan speed, etc. I know someone who is interested in buying a PRO-2004/2005 and would like more info on these mods. Mon 01-29-1990 [07:38] "Someone who is interested"??? Heh heh heh. Yeah, I don't listen to the CMT band, either. That ECPA has got me just _petrified_, hi. :-)I got these off a bulletin board.

---------------+| Modifications for the 2005 |+---------------

There is a socket that is not marked so it will be referred to as D501.

D501 and D503 removed: Scan rate of 6/12 cps
D501 only installed : Scan rate of 7/14 cps
*D503 only installed: Scan rate of 8/16 cps
D501 and D503 installed: Scan rate of 10/20 cps (horray!)
*D502 installed : Disable 823.95-850.95 MHz and 868.95-895.95 MHz
D502 removed: Full coverage from 760-1300 MHz
D504 installed: Normal spacing for all bands.
*D504 removed: Enable 30 kHz spacing in areas restored by D502 removal

* = Stock US model configuration

PRO 2006

From: rats@ihlpm.UUCP
Newsgroups: rec.radio.amateur.misc
Subject: Re: PRO-2006

PRO-2006 Modifications

NOTE: The Electronic Communications Privacy Act of 1986 makes it unlawful to monitor mobile telephones, including cellular. The following modification is intended only to restore continuous 760-1300 MHzcoverage as originally provided by the design of the PRO-2006 microprocessor. BE SURE TO TEST YOUR PRO-2006 FULLY BEFORE ATTEMPTING THISMODIFICATION. ANY MODIFICATION MAY VOID YOUR WARRENTY.

824-851, 869-896 MHz Frequency Restoration:

Tools Required: small Phillips screwdriver, small wire cutters.

Procedure: With the power cord unplugged, remove the two rear cabinet screws holding the upper cover. Lift off the upper cover, being careful not to stretch the speaker leads. Examine the inner, right-hand-corner of the front panel to find two glass diodes, labelled D503 (upper diode) and D502 (lower diode). Using the clippers, very carefully snip the visible lead of the lowerdiode (D502) at its bend and slightly separate the cut ends. If it is ever necessary to send the radio back for warrenty repair, the diode leads should be carefully resoldered. Reassemble, plug in AC cord, turn on scanner, and press RESET.

Keyboard Beep Delete:

With the top cover removed as described above, locate connector CN3, a 15-pin connector with colored wires at the front of the main circuit board. There are two precedures which w ill stop the beep tone from being heard through the speaker; read both to decide which procedure you want to follow.

(1) Find the center grey wire coming from CN3 and cut it midway to disable the beep tone. You may wish to solder a resistor in series to reduce the beep

volume, a trimpot to vary the volume of the beeptone, or a minature switch to choose between beep and no beep.

(or)

(2) Using a pair of needle-nose pliers, CAREFULLY pry the plug from CN3,revealing a row of pins. Locate the center pin (#8) which corresponds to the grey wire and bend it down flat, disabling the beep circuit. Reinsert the plug. The pin may be erected again later to restore the beep tone if desired. This completes the restoration procedure. Reattach the cover and
replacethe screws.

Brasstown, NC; 1-704-837-9200

==========

PRO2022

Cellular Restoration on the Realistic PRO-2022

The Realistic PRO-2022 certainly is a look-alike for the all-time popular, but now-discontinued, PRO-2005. But is the similarity only cosmetic? What tricks can be done to increase the utility of the lower-cost 2022, now availible from Radio Shack and Grove Enterprises? Of the greatest interest, can cellular phone coverage, censored at the factory, be restored? Yes.

After removing the two upper back screws and the top lid, locate the black cable just behind the front panel. Adjacent to the cable are four diodes locations: D42, D43, D44 and D45.

D42 is not present; installed, it adds the 68-88 MHz European mid band (which includes the US 76-82 MHz mid band), removing the US 30-54 MHz low band. Even if a switch were installed to allow the diode to be selected, additional components and realignment are necessary for that higher frequency coverage. Don't do it!

D43 is present, allowing the 800 MHz band to be received; the diode may be deleted so that the same microprocessor may be used in scanner modles which don't have that 800 MHz capability. Don't touch it!

D44 is present, deleting the cellular mobile and base frequencies. If one lead is cut, total 806-960 frequency is restored, including 30 kHz steps in the cellular band. Keep in mind, however, that mobile telephone eavesdropping is prohibited by the Electronic Communications Privacy Act!

This modification may void your warrenty; it is best to cut the lead carefully, gently separating the gap slightly so that it may be resoldered in case the radio needs warrenty repair later.

D45 is not present; installed, it makes the cellular 30 kHz increments change to 12.5 kHz. A small SPST switch connected in series with one lead of a 1N914 or 1N4148 could allow selection of the 25 kHz step interval in those areas which utilize that channel spacing.

To do this, it is necessary to unsolder a shield under the circuit board which covers the solder pads for the diodes. Such a modification should only be attempted by someone familiar with electronic circuitry.

[Excerpted from Monitoring Times, June 1990, page 89.]

PRO 2026 800 MHz cellular restoration

From: steuer@clam.rutgers.edu (robert Steuer)
Newsgroups: alt.radio.scanner
Subject: PRO-2026 MODS!!!
Message-ID: <Oct.20.10.55.49.1992.11077@clam.rutgers.edu>
Date: 20 Oct 92 14:55:50 GMT
Organization: Rutgers Univ., New Brunswick, N.J.
Lines: 29

Hi all, just got these mods, hot off the FAX! Note: It is not lawful to monitor cellular or conventional mobile telephone conversations. The 2026 has cellular frequencies deleted at the factory, but restoration is the easiest ever! - clip one marked wire! All you needis a Philips screwdriver and wire cutters.

1. Turn the scanner upside-down and remove the four side screws holding the bottom cover in place; pull the cover loose and set it back about two inches out of the way.

2. Locate the small circuit board at the lower right-hand corner andfind jumper L201. Cut it and slightly separate the break.3. Reassemble the radio which now has continuous 806-956 MHz coverage and 30KHz search increments in the cellular band.

*** I have not tried the above mod, but did acquire it from acommercial radio dealer who is very respectable, so as always, proceedat your own risk and realize that this will violate your warranty! Have Fun! Rob KF2EK---

PRO2027

RESTORATION OF CELLULAR FREQUENCIES FOR RADIO SHACK PRO-2027

For those that are interested, the following modification will enable uninterrupted reception of the 806MHz - 960Mhz spectrum. This modification may be useful to those who use a scanner in conjunction with down converters for satellite monitoring. Channel step size in the cellular band is increased to 30KHz. PLEASE BE ADVISED THAT IT IS ILLEGAL TO MONITOR CELLULAR TELEPHONE CONVERSATIONS. Not only is it illegal but unethical.

With the advertisements out of the way here's how its done.

1. Unplug unit. (Obvious but I must say it.)

2. Remove bottom panel (4 screws)

3. Locate diode D35 located behind the enter key. This is a surface mounted component that resembles a tiny black square.

4. Unsolder D35. I prefer to unsolder one leg so that the original functionality can be restored for resale. This can be done by gently prying up the component with a pin or tweezers while touching one leg with a soldering iron. Don't apply too much heat a 15 - 20 watt soldering iron is more than adequate.

5. Button it up and turn it on. No reset is needed.

PRO2030

PRO2030 Mod

From: Jeff Goldman, 76703,4224
To: Roy Brown WB0MFV, 75225,1406
Topic: Pro 2030 restore
Msg #200480, reply to #200474
Section: VHF/UHF Scanning [2]
Forum: HamNet <Ham Radio>
Date: Fri, Aug 27, 1993, 6:49:19 PM

It's a wonderful scanner there, Roy. I bought it (used the 10% Off New Items coupon in the new catalog) and modified it.
The mod takes about 2 seconds. :-) I'm in a high RF area, so intermod was pretty bad. I swapped the tiny Pro2030 with a friend's BC890XLT that has a PL board. (I'd sold him my BC890XLT about a month ago to make room for the upcoming BC8500XLT, but decided against the 8500 in the end. <g>)

Anyways, take out the screws so you can open up the 2030. Looking down into the top of the scanner right behind the
front panel you'll notice a little metal loop that's labeled L201. CLIP that jumper and move the two pieces a little away from each other. The loop's so small and rigid that if you
ever need service, you could bend the to parts together and nobody would know you snipped them.

-Jeff

BC 200 XLT
BC 205 XLT

UNIDEN/BEARCAT 200/205XLT TEST MODE

by Bob Parnass, AJ9S

According to the Uniden/Bearcat 200/205XLT Service Information Manual, the following procedure will load channels 1-25 with various test frequencies, and zero the remaining 175 channels:

1. Press and hold three keys: 2, 9, and MAN simul-taneously and turn the power switch on.

2. Set the power switch to the off position.

3. Repress and again hold three keys: 2, 9, and SCAN simultaneously and turn the power switch on.

BC200/205XLT CELLULAR RESTORATION

Note: It is unlawful to monitor cellular telephone conversations. It is possible to monitor signals from the deleted ranges even without conversion. Simply add 21.7 MHz to the deleted frequency and enter the higher (image) frequency. Reception is virtually identical in strength to that which would be heard on the deleted frequency.

The frequencies deleted at the factory may be restored, but the procedure must not be attempted by anyone unfamiliar with electronic circuitry. Grove Enterprises assumes no liability for damage caused by this procedure. (I won't eighter! WA2ISE). The modification will void
your warranty.

TOOLS REQUIRED: Small Phillips screwdriver, small wire cutters.

1. Slide off the battery pack and remove the antenna from the scanner.
2. Using a small Phillips screwdriver, remove the two screws from the back of the scanner, the two screws which hold the battery retaining spring at the base and the spring itself.
3. Carefully pry the bottom of the rear cover from the radio and remove the cover.
4. Locate the two small screws at the base of the circuit board and remove them. Gently pull the front panel from the mainframe at the base and separate them.
5. Locate the (64 pin quad flatpack) microprocessor IC labelled "UNIDEN UC-1147" and the 10k ohm (brown-black-orange) leadless resistor positioned above the letters "DEN" on the IC.
6. Using miniature wire cutters, cut the resistor body in two without disturbing anything else near it. If the left solder pad comes loose, it may be peeled from the board. Brush or blow away any residue. This completes the restoration.

REASSEMBLY

7. Insert the top of the front panel into the slot under the volume/squelch control panel and, noting carefully the alignment of the dual inline connector at the bottom of the board with the mating socket, press the front panel firmly into place. Be sure that the holes at the bottom of the circuit board line up with the holes in the plastic standoffs below them. Insert the two screws and gently tighten them.

8. Replace the back cover by inserting the top of the cover into the slot under the volume/squelch control panel; press the cover into place, insert and tighten the screws.

9. Reposition the battery retaining spring (slotted side toward notched hole), insert the two remaining screws and gently but securely tighten them.

10. Slide the battery pack into place; switch the scanner on to make sure the display comes on. If not, the battery is discharged or the dual-inline connector was misaligned during assembly
(see step 7).
Assuming the display comes on, press: MANUAL, 845.0, E; within two seconds, the frequency 845.000 should appear on the display.
Cut this resistor

BEARCAT BC200/205XLT SCANNER MODIFICATION

RESTORING THE DELETED 800MHZ BAND OF YOUR BC200/205XLT CAN BE ACCOMPLISHED EASILY BY LOCATING THE MICROPROCESSOR LABELED,"UNIDEN UC-1147". ONCE YOU'VE IDENTIFIED THAT IC,LOCATE THE 10K OHM RESISTOR (BROWN-BLACK-ORANGE) POSITIONED ABOVE THE LETTERS "DEN" ON THE IC. THE RESISTOR IS LEADLESS,SO TO ACCOMPLISH THE MOD,SIMPLY CUT THE BODY OF

THE RESISTOR IN HALF. USE MINIATURE WIRE CUTTERS.

DO NOT DISTURB ANYTHING NEAR IT. IF THE LEFT SOLDER PAD COMES LOOSE,IT MAY BE PEELED FROM THE BOARD. BRUSH OR BLOW AWAY ANY RESIDUE.

NOTE*** IT IS UNLAWFUL TO MONITOR CELLULAR TELEPHONE CONVERSATIONS

73 DENNIS WB2WPO @ KE2KQ HUNTINGTON NY (ZIP 11743BC200XLT.6

ALL USERS OF THE BEARCAT 200-XLT HANDHELD SCANNER HAVE PROBABLY HAD PROBLEMS CONCERNING SHORT BATTERY PACK LIFE. BATTERY INDICATOR COMES ON TOO SOON. AFTER TINKERING AROUND WITH THE RIG, A SIMPLE SOLUTION HAS BEEN FOUND. THIS MOD WILL VOID YOUR WARRANTY AND YOU DO THIS AT YOUR OWN RISK. [I HAD NO PROBLEMS WHATSOEVER.]

1. SLIDE OFF BATTERY PACK.
2. REMOVE TWO SCREWS ON BACK OF RIG.
3. REMOVE TWO SCREWS ON BOTTOM OF RIG THAT HOLD CLIP IN PLACE.
4. CAREFULLY REMOVE BACK OF SCANNER.
5. REMOVE TWO SCREWS AT BOTTOM OF BOARD NEAR RED CONTACT WIRE. L+R
6. SEPERATE THE TWO BOARDS VERY CAREFULLY. CONNECTED BY 16 PIN DIP SOCKET. 7. BOARD IS PH-069AA OR PH-O69AC. POSITION BOARD WITH DIP SOCKET AT LOWER RIGHT HAND SIDE.
8. AT LOWER LEFT OF BOARD, NOTICE TWO ELECTROLYTIC CAPS. C-214 C216.
9. D-203 IS LOCATED JUST ABOVE THESE TWO CAPS. IT IS A GLASS TYPE ZENER DIODE WITH COLORED BANDS FOR MARKINGS.
10. WITH A SMALL, FINE PIECE OF WIRE SOLDER ACROSS DIODE D-203.
11. THAT'S IT!!!!!! NOW THE BATTERY INDICATOR WILL NOT COME ON AND YOU WILL NOT BE BOTHERED BY TURNING OFF AND ON THE RIG TO RESET THE TIMER. [THUS ENABLING YOU TO USE THE NICAD PACK TO IT'S FULLEST EXTENT.] DISPLAY BLANKS OUT AT ABOUT 4.5 VOLTS.
12. RE-ASSEMBLE RIG IN REVERSE ORDER AND YOUR IN BACK IN BUSINESS.

MARK N8JCF @ WA8OOH

BC 760 XLT
BC 950 XLT

Bearcat BC 760 XLT mods

BC760XLT
Concerning the Uniden Bearcat 760xlt, the mod for the 950xlt does work to restore lost freq. Disconnect pin 20 of the microprocessor from the circuit board and connect it to pin 19. I bent the pin slightly and cut it with the scissors of a swiss army knife then soldered an 1/8 lead cut from a cap across the pins near the top of the chip. I've yet to find any problem with this mod. But as always do so at your own risk.

****

THE FOLLOWING "MAGICAL" MODIFICATION WILL ALLOW RECEPTION OF CELLUAR PHONE BAND ON A BEARCAT 760XLT. NOTE- THIS MODIFICATION SHOULD BE PERFORMED BY SOMEONE VERY

FAMILIAR WITH ELECTRONIC COMPONETS. THIS WILL ALSO VOID
YOUR WARRANTY. AUTHOR ASSUMES NO RESPONSIBILITY WHATSOEVER.

1- Disconnect power cord from wall outlet, remove the four screws
holding the bottom cover on. Remove bottom cover carefully, speaker wires are
attached.

2- Locate the large 64 pin microprocessor chip near front of the radio. Noting
the indented dot which marks pin one, count along row to pin 20. Cut that pin
close to the circuit board so if you ever want you could tack solder it back
together.

Chip im my unit has following numbers:
7D3
HD 40740085
JAPAN

3- Temporarily reconnect power to the radio and attempt to program 845.000 Mhz.,
confirming cellur band restoration. Frequencies may be entered in 12.5 Khz,
not 30 Khz, increments.

4- This completes the magical instructions, disconnect power, reassemble scanner
in reverse order. Rember performing this magic voids your warranty, not to
mention the fact it is illegal and if the King's "henchmen" catch you, you mab
be severely fined or maby even thrown into dungeon.

BC 2500 XLT

NOTE: since receiving this mod, I have been told that there are two
different pc board designs for the 2500xlt. Make sure you have the
unit that corresponds to this mod.

This is the cellular restoration mod for the Bearcat 2500xlt.
The diagrams included make things much easier to understand.

1. Remove the antenna and battery pack from the BC2500XLT. Lay it on
its face on a soft cloth or towel, bottom of the radio facing you.
Remove the two upper (black) and two lower (chrome) screws.

2. Carefully pry the back loose from the radio and lift it off.
Similarly, grasp the visible circuit board by the edges and carefully
pull it away fron the radio just far enough to separate it from the
white (11 pin) Molex connector. Do not stretch the remaining ribbon
connector. Lay the board alongside the radio.

3. Locate microprocessor chip "Uniden UC-1513A", and the cluster of
chip resistors marked "104" below it (see diagram). Using a
magnifier and fine-point soldering iron, unsolder the
lower-left-most chip resistor and move it one place to the
left, soldering it in place.

Reassemble the radio by reversing steps 1 and 2, and test it by
entering 879.990Mhz. Search steps in this range will be the
correct 30 KHz.

BC 855 XLT

Here is a repost of John Wilkerson's article from Feb 1993
on modifying the Uniden 855XLT:

UNIDEN BC-855XLT MODIFICATIONS
Scope of modifications:
[1] Allow continuous 800 MHz receive.
[2] Increase channel capacity from 50 to 100 ch.
1 2 3 4
:----------:
| I p p p p o o o o o o |
:----------| I | | | | |
[I]		X X <-- CUT
[I] D201				
[I] oooooo				
I d d d d

| I------/\/\/\--------|--| |
| |
| ADD 4.7K - 22K Ohm (10K works) |
| 1/4 watt carbon resistor between |
| diode D201 and lower connection |
| of Jumpers 3 & 4 |
Jumper 3 - 100 ch. Jumper 4 - 800 MHz
1. Remove 5 screws from bottom of scanner case.
2. Carefully separate case top and bottom.
3. Unplug connector to the internal speaker.
4. Locate diode D201 and 4 jumpers near edge of circuit board.
5. Cut the 3rd and 4th jumpers near the middle and fold
downwulate leads, if necessary.
6. Connect the lower part of jumper 3 & 4 to one end of a 10K
Ohm 1/4 watt carbon resistor, insulate all exposed leads.
7. Connect the other resistor lead to the lower connection of
diode D201, DO NOT cut any leads on D201.
8. Make sure all exposed leads aren't touching any other
connections, insulate as required, tack in place
with a dab of RTV silicone, or low temp hot glue.
9. Reassemble scanner, make sure to plug the speaker back in.
You should now have a scanner with 100 chs. numbered 01-00 ☐
in 5 banks of 20 ch. and continuous 800 MHz coverage.

WARNING!!! Doing the mod to jumper 4 REMOVED 75 percent of the 800 MHZ
Band on my Scanner. Replaciing the jumper restored the
coverage to design limits, without harming the Scanner.

My serial # is 25021343.

I suspect different boards have been used in this scanner.

ADDITION: My scanner had the jumpers depicted. However, there were 2
more jumpers after those depicted. Disregard any additional

1274. Re: Battery charging Q

Newsgroup: rec.radio.scanner
Date: 1999-02-12 00:00:00 UTC
From: Tom McCuen <tjmc@erols.com>
Message-ID: <36C441BE.DBEE0731@erols.com>
Source record: 127883

No, not ruined.....

Nicad's charge at an 80% rate. So, take yr mA rating of the charger,
divide it into the mA rating of the battery to get time in hours, then
add 20% more time.

Exp.; charger is 100ma, battery is 1000ma
1000 / 100 = 10 hrs ...
then add 2 hrs more for the 80% factor.
Total time = 12 hrs

In answer to yr orig question, the new charging time will be less than
1/2 with the higher ma charger.
But, One of the killers of NiCads is heat , so in the long run it's
better to do the slow charge. Usu a C-10 charge is the best (C-10
means 10% charge of total battery, in example above the 100ma charger
gives a C-10 charge to the 1000ma battery)

Hope it makes sense

Tom

1277. VHF Range question

Newsgroup: rec.radio.scanner
Date: 1999-02-12 00:00:00 UTC
From: Richard Greaney <greaneyr@inspire.net.nz>
Message-ID: <36C360E9.2CED826B@inspire.net.nz>
Source record: 127929

I can faintly detect a modulation signal from an airport some 130Km away from me. It is on their ATIS. My Bearcat 3000XLT has a birdie right on 126.90 and when i am actually AT this airport, there is a strong tone audible when their ATIS transmission clashes with my birdie. Same for their tower on 118.80MHz. I can also detect this tone from my home, 130km away. It stops periodically as the ATIS stops transmitting.

My question is, would it be possible to amplify the signal to an audible level? The scanner is proving that it can detect the airwaves in the atmosphere.

There is some terrain between the airport and my home.

Any suggestions?

Thanks
Richard Greaney

1278. Re: ?s-4-dj-x10 owners

Newsgroup: rec.radio.scanner

Source record: 127930

Yes, I got a new DJ-X10 a couple of weeks ago as well. I am getting about the same 4 to 5 hours per charge. I also got the two nicads instead of 1 nicad and 1 dry cell case. I'll take the second nicad .. it's worth more!

I have a Radio Shack "wall wart" DC supply that powers the unit just fine and will recharge the batteries, though it seems to recharge at a much slower rate .. meaning your could likely leave the power supply plugged in all the time and not overcharge the nicad.

Mine receiver came able to hear the cell (869 mhz, etc.) frequencies out-of-the-box. Unfortunately as I was messing around trying to find a want the clear the mute on the preprogrammed frequencies, I did a reset of the rig and my ability to program in the cell frequencies went by-by. But, as you say it hears the cell images so well that it is not an issue.

I downloaded the PC software (from the link on the Alinco.COM DJ-X10 home page) and then built the home-made interface cable from Radio Shack parts (3 transistors, 2 diodes and 5 resistors). It worked the first time. I was able to dump the X10's memories to the PC and saved them to a file. The only way I could then clear the "muted memory" problem was:

You need the registered version of the DJ-X10 programming software. (Worth the $10 registering fee in my opinion).

On the PC:
1. Upload all memory channels to the PC and save them in a file. Make sure you have done this properly and saved the file to disk .. the next two steps will wipe out all DJ-X10 pre-programmed frequencies and labels, etc.

On the DJ-X10:
2. Store some new frequency in each of one memory bank's 40 channels.
3. Copy this memory bank into all of the other memory banks. (Using the DJ-X10's MR Edit menu command.
At this point the muted situation is cleared, but unfortunately so are the preprogrammed frequencies.

On the PC:
4. Use the shift-control-alt E command to export the saved file to a "CSV" file. This is a file format that can be read and written by most spreadsheets. Using the spreadsheet program you can then pretty easily go in and alter the frequencies and labels for any of the channel contents. This is a good time to set up the memory banks and contents to your liking.

5. Use the shift-control-alt I command to import this file back into the
DJ-X10 programming program. This export and then import is what seems
to clear the mute situation.
6. Write this set of memory contents back into the DJ-X10.

At this point the mute situation is gone.

I have very much enjoyed the DJ-X10 to this point. It seems to be
reasonably sensitive (including on shortwave) and a nice set of
features. The ability to save labels with the frequencies is a very
powerful feature. A good, solid rig.

On the PC

Hello,

I bought a 235 XLT today and started to charge my battery with my 2500
XLT AC adapter. I used the 235 XLT adapter to play with my new toy.
I then noticed that the 235 XLT was rated at 200mA while the 2500 XLT
adapter was rated at 500mA. Did i ruin my battery?
The manual tells me to charge 14-16 hours. Should i charge my battery
for a less amount of time now?
If so, how long should i charge it?

Thanks
DDT

Hi Mike,

I think you asked about this last June and I posted
this response:

ICOM IC-R7100A

If I recall, I tapped into the junction of R228 and R230.
R228 and R230 are located next to each other
on the "Main" printed ckt board, next to crystal discriminator X3.

I used RG174/U miniature coax cable to connect
the junction of the resistors to an RCA jack added
on the rear apron.

Consider buying an R7100A service manual from ICOM.
The current price is about $46 plus s&h. It contains
a wealth of info, including board layouts, theory, etc.

Good luck and happy monitoring.

Source record: 127638

Hello everyone!

I have a new AOR-3000A Wideband receiver for sale.
Coverage is 100kHz-2036MHz (less cellular).
Unit is in original box with all cords and manuels.
Telescoping antenna is also included.
Please note: manuel has been opened but is in excellent + condition.
Also please note: This unit has been stored in bedroom closet 4 years.
I have tested unit only to ensure unit is working properly. Needless
to say, this receiver is working flawlessly.

This unit is being sold together with a new GRE converter 9001.
The GRE model is designed for base model receivers.
All accessories are new and included with original box.
Cable, adapters, and manual are all new in packaging.
Please note: This unit has also been stored in bedroom closet 4 years.
I have tested unit only to ensure unit is working properly.
It is working perfectly.

Both units utilize BNC connectors. Included.

Keep in mind the GRE converter may be used with any radio receiver/scanner
that has restricted frequency coverage.

Both these units will be sold together and cannot be sold seperate.

I will include shipping + insurance of both these units for $825.00.
The price is firm. Please e-mail me with serious inquiries only. I will
be more then happy to relay any infomation needed to prove authenticity
for this ad.

If you're asking why I'm selling these units, it is because I already
have 2 AOR-3000A units that I use frequently for monitoring.

The AOR-3000A wideband receiver is an advanced class receiver.
Should you consider adding this combination package to to your listening
post, please e-mail me.

**** Monitoring cellular conversations is now illegal in the United States.
Should you purchase this package from me, I ask you adhere to the laws
that govern the areas in which you choose to monitor with these devices.

Thank you all for reading my posting.

Which Winradio are you talking about? The Winradio 1500e I have is
shielded much better and has a much more robust construction than the
PCR1000 which I tested thoroughly before I decided on the Winradio.

Sounds like an advertisement! :-) Brand name loyalty is indeed an
admirable thing, as long is doesn't prevent one from considering new
alternatives which may perform better or be better value for money. I
personally feel that Icom has lost the plot ages ago, but I am still
prepared to consider them again (or anyone else for that matter) if
they come up with something new and good in the future.

Oh come on. 'shielded much better'? What exactly makes an overlapping
aluminum case any different than an overlapping steel case? Same for 'more
robust construction'. You could pound nails with either one.

Quote performance if anything.

I had a chance to briefly own both the PCR1000 and the WinRadio WR-1500e using them side by side. The WinRadio is clearly a much better made product as far as it's construction is concerned. I stated this in my review on the www.strongsignals.net site. However it is just as deaf and noisy below 30mhz. I have yet to see a radio competent below 30mhz that also does the vhf-uhf as well. Neither unit does as well or better than a similarly priced handheld however, and if you can live without the slick computer interface, there are much better choices.

Ryan, you didn't say whether you wanted to use the unit as a desktop base station, a mobile car unit, or a handheld. Some information there would help us make recommendations.

If you mount the unit in a car, you may be in violation of local ordinances; check the laws in your area. BTW, federal law would also prohibit your listening to cellular phone conversations, so you see there's no need for you to request any mods, since you wouldn't want to use them anyway.

I *want* a pro 26, full coverage and handheld too :-)

Why oh why does Radio Shack refuse to include mil air band in their
handhelds ? And why did they take the Pro 26 off ? I would almost kill
for a pro 26... almost.

One thing, are mil air broadcasts usual AM or SSB ? LSSB or USSB ? Can
the pro 26 do SSB or only AM ? What is a good handheld for someone who
wants to listen to SSB as well as AM and possibly CW (but who is not also
rich as well :-( )?

How can you import Sysbase databases using Microsoft Access, or any other popular database software?

I downloaded FCC databases from their web page, but they are all in Sysbase format.

Thanks...

1299. CHP Extender Observation

Newsgroup: rec.radio.scanner
Date: 1999-02-13 00:00:00 UTC
From: ksmith@best.com
Message-ID: <36c60f07$0$203@nntp1.ba.best.com>
Source record: 127651
Cross-posted to: rec.radio.scanner,alt.radio.scanner

The other night on the way home from work I happened to pass a CHP car at the scene of minor accident. I enabled the extender frequency on my scanner -- usually locked out because of intermod problems -- and noticed that the extender was broadcasting audio from the base AND mobile frequencies. I determined this by hitting "scan" after the scanner stopped on the extender frequency and noticing that the audio from the extender matched audio on both the base and mobile frequencies (not at the same time of course). This meant that the CHP officer standing by his car was able to receive all transmissions. Does anyone know if this is this normal operation of the extender? Btw, they aren't using a repeater in my area yet.

I've always assumed that one of the reasons the CHP used base and mobile frequencies was so the mobile units wouldn't have to listen to potentially weak and scratchy transmissions from other units who may be far away. If they needed to talk car-to-car, then they switched to simplex operation on the base frequency. After hearing the mobiles on the extender, I'm wondering if officers have the option of listening to the mobile frequency while in the car too.

I'd be interested in hearing what anyone knows about this.

Cheers,
-Kyle

When I lived in Missouri several years ago, the SHP used General
Electric MASTR II mobile radios with the large scanning control head.
they could scan all of the mobile and base freqs and it was not
uncommon to hear all of their freqs coming out on the extender
frequency. It sounds like CHP has the same capability.

I forgot.... I was told the reason for 2 frequencies was so that the
base stations could receive and transmit at the same time (full duplex)
so the dispatchers could always hear the mobile freq and a car could
break in on them in with emergency traffic. also so that other strong
base stations can't cover up the mobiles that might be far away.

From: citizen <of@the.USA>
Message-ID: <36C63271.CFE7094F@the.USA>
Source record: 127659

Stop H.R. 514

The intent is pretty clear that this bill goes way beyond wireless radio privacy. There are now enough technologies and criminal laws that protect our wireless privacy. We that know our radio technology know these laws will do more harm than good. Current laws restricting scanners are bad enough and should be repealed. Other countries will profit from these bad laws.

You should realize the scanning hobby does our society good. My expertise makes my hobby look easy. It is very time consuming and more complicated than it seems, even with all the hobby related information that is available on the internet. Terrorist or criminals would have a hard time using it to their advantage. Scanners are a way to fight crime and a personal protection aid. Scanners inform us in ways better then the internet. For example, services instantly heard on a scanner regarding emergencies, crimes, accidents, etc. This is the fastest way to get time critical information. Thus, citizens can better protect themselves and better assist our government.

I believe in internet privacy, but radio-restricting privacy laws are not sensible solutions. Current laws and more laws putting technical limits on radio reception equipment is not the answer. Radio voice and radio data encryption are already used for radio privacy. I consider the current and proposed laws on radio scanner manufacturers, putting restrictions on radio scanners for citizens purchase, as restricting our rights. It is a form of information censorship. Plain and simple, no radio spectrum listening restrictions is needed due to encryption. Stop H.R. 514 and repeal related laws.

House Representative Michael Oxley (R-OH), former FBI special agent, supports H.R. 514 and I believe he was the one that purposed the C.D.A. II bill. Congratulations to everybody fighting against C.D.A. II for something more important, keeping our freedom!

Imagine if laws were passed, just after the invention of radio, restricting citizens reception to parts of the radio spectrum. They could have stopped citizens way back then, but it would have been wrong and un-American. The basic principles of freedom of the past should apply today and in the future.

Did you know there was wireless phone networks and radio receivers for the public before the development of cellular and scanners?

Write to Congress, but more effective is getting the message to their voters through the local media of their district.

In many areas of your country your government has been purposing new laws to keep the live press away from police operations. The poor excuse is to protect the police. Does that mean the citizens should not know too much about what our government does because you can always trust them, since they never break the laws? The same thing for scanners. Does that mean you should not listen to what our government is really doing, it is none of your business, just pay your taxes and do what they tell you and you will be better off?

Should there be new laws controlling the costly use of private radio networks by our government to save taxpayer money, since they have their own expensive and efficient government radio networks they can use? But would that be bad because it would cost the industry and save the taxpayer?

Looking for the geographic zone boundaries utilized by the MSP for it's
low-band
communications in the State of Michigan. I have the alphabetical number
vs frequency
pair, but need the geographic zone locations.

Please respond by email to: wbecks@sun.lssu.edu

Thanks,

Bill

Regarding my initial post about the officer who was killed here in Sacramento, I did not post this with the intention of starting a flame war. I truly am sorry that this officer was killed in the line of duty, and I knew that the LEO's in alt.law-enforcement would be too, as would some non-LEO's and scanner listeners in alt.radio.scanner and rec.radio.scanner. My post was relevant to scanning because I heard the incident on my scanner. I also know that some people in the scanner newsgroups work in public safety, so they might have been interested in seeing what I posted initially.

good point. a cop came along side me
and heard my scanners and i knew he was
going to do something. so i pulled
off at light and sure enough, he lit me
up.

he pulled me over for not wearing my seat
belt at 3 am in the a.m. No cars on the
road muchly. finished writing the tickeet
for not wearing...27 bucks plus admin fee
for total of 43 bucks.

then he grilled me about my scanners and
my portables....i asked him: "got a warrant?"
"got probable cause"...

he handed me the ticket anyway.

nice law...gives cops reasons to
"assume" and pull you over
for innocuous points of law
at 3 a.m. in the a.m.

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA.
High level overviews of the following topics are presented:

Why Scanning?
Is Scanning Legal?
What Scanner Should I Buy?
What is a CTCSS and DCS Tone Squelch Feature?
How Do I Determine the Proper CTCSS or DCS Code?
Scanner Antennas
Coaxial Cable Feedlines
Where Can I Buy A Scanner?
Modifying Your Scanner
Scanner Repair Shops
Where Can I Obtain Frequency Information?
Do Your Own Frequency Detective Work
How Can I Use Equipment to Uncover New Frequencies?
Scanner Clubs and Mailing Lists

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,

taxis, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, neighbor and domestic disputes, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss strategy with his advisor from a 415 MHz radiophone in Air Force 1, or a team of G-men protect him while transmitting in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. Public law 103-414, signed Oct. 25, 1994, amended the law (Title 18 USC, Part I, chapter 119, sections 25110 and 2511) and outlaws listening to cordless phones, too, but many scanners cover these frequencies.

It is illegal for companies to sell or import into the USA recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

The rules define "readily altered by the user" as "clipping the leads of, or installing, a simple component such as a diode, resistor and/or jumper wire; replacing a plug-in semiconductor chip; or programming a semiconductor chip

using special access codes or an external device, such as a personal computer."

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations and the AR5000 works well.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. Beware of low cost programmables which can't search. Some of the newer models, like the Uniden SportCat and Radio Shack PRO-2046, allow searching between limits, but the limits are factory programmed and cannot be altered.

Get a model which covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 50 channel scanner will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often second rate. The $2000 Icom R8500 and AOR AR5000 models are exceptions.

Deluxe scanners can be controlled and/or downloaded by a personal computer, a feature which appeals to a small but growing number of scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC200XLT (a/k/a BC205XLT), BC220XLT, BC230XLT, and Radio Shack PRO-43 and PRO-60 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The Uniden BC9000XLT base and BC3000XLT portable work very well and are my current favorites.

Looking for value? At $180 discount price, the 100 channel Uniden/Bearcat BC860XLT base is a good value and available at most Wal-Mart stores. The RELM HS200 portable performs very well is an excellent value at its $250 street price.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 was replaced by the 1000 channel PRO-2035, which was replaced by the PRO-2042. The portable Radio Shack PRO-64 and PRO-60 are good performers. All five models employ up conversion and are made for Radio Shack by GRE (General Research Electronics).

CTCSS and DCS Tone Squelch Feature

Upscale scanners can be optioned with a subaudible tone decoding squelch circuit. There are two types: CTCSS (Continuous Tone Coded Squelch System) and DCS (Digital Coded Squelch). In simple terms, this feature lets your scanner ignore signals you don't want to hear.

Most land mobile two way radios, except trunked systems, transmit either CTCSS or DCS signals subaudibly along with the voice information. U.S. military field radios employ wider deviation and a 150 Hz CTCSS tone, not supported by most scanners or CTCSS decoders.

There are over 40 different CTCSS codes and you can program a specific CTCSS or DCS code into each memory channel. Using a CTCSS or DCS decoder permits your scanner to open the squelch only if the transmission has a code which matches the code you program.

CTCSS and DCS decoding offers several advantages:

1. Ignore unwanted signals on shared frequencies: It is common for several users to share the same frequency, e.g., my county sheriff uses the same frequency as Chicago Police, located about 60 miles away. I want to hear my sheriff's transmissions but don't want the scanner to stop on or listen to Chicago Police transmissions. This is especially a problem when radio propagation is good, e.g., during a "band opening," when reception range is temporarily increased.

2. Combat intermodulation interference: Helps keep out intermod and image interference from strong pagers and other signals which are not transmitted with a matching code.

3. Ignore scrambled transmissions: Many federal law enforcement agencies (FBI, Secret Service, etc) and some local police agencies employ digital voice scrambling, which sounds like white noise and is annoying to hear. The CTCSS or DCS code is sent only when the station is transmitting unscrambled, or "in the clear." You can program federal frequencies along with the proper code into your decoder-equipped scanner so you won't have to listen to the scrambled mess and only hear their transmissions when they are unscrambled.

CTCSS also goes by various tradenames: Motorola's PL (Private Line), GE's Channel Guard, and RCA's Quiet Channel. Motorola uses the tradename DPL (Digital Private Line) for its digital coded squelch.

How Do I Determine the Proper CTCSS or DCS Code?

There are a few ways to determine the CTCSS or DCS code transmitted by a station:

1. Use an outboard CTCSS/DCS reader which must be attached to the discriminator output circuitry inside the scanner. The reader has an LCD or LED display which indicates the code when a station transmits. I use a CSI model CD-1 Communications Decoder Unit, an an excellent reader which sells new for about $200. (Connect Systems Inc., Ventura, CA, 800-545-1349, www.connectsystems.com).
2. Many of the ScannerMaster guides, as well as scanner club newsletters, print the CTCSS codes used by transmitting stations.
3. On some scanners equipped with the CTCSS squelch, you can program into memory the frequency of interest. Then you "tune" slowly through all the different CTCSS and/or DCS codes until the squelch opens and you hear the dispatcher talking. This is a slow process and the station has to keep transmitting during it.
4. A slow, brute force method is to program the same frequency but a different CTCSS code into several channels and see where your scanner stops.
5. In some cases, I've actually examined the walkie-talkies I want to monitor and found the CTCSS code printed on a label on or inside the radio.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer these alternative antennas for use with portable scanners:

1. The Icom FA-1433B dual band flex antenna, a thin and very flexible rubber antenna, is slightly longer than a stock heliflex but provides better performance.
2. The Austin Condor is a 12" long rubberized antenna available for about $30. While considerably longer than the stock antenna and the FA-1443B, the Condor is very flexible and provides VHF-high band reception superior to both. It is not designed to cover the VHF-low band, but will allow reception there at least as good as shorter antennas. The Austin Condor is available from Grove Enterprises.
3. The "Thin-Stick" is an 18 inch telescoping antenna for

extended range. It is made in USA by Smiley Antenna Co., Inc. and is designed to cover both the 2 meter and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A (available from Amateur Electronic Supply) or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 50 miles or more, depending on terrain. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U, e.g., Belden type 8267, has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Be sure it is on sale, as Radio Shack list prices are high and their scanners are offered at reduced prices by mail order discounters.

Discount chain stores like Wal-Mart, Best Buy, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902. For a free catalog, call (828)837-9200. Telephone (orders only): (800)438-8155. Web page is http://www.grove-ent.com

- National Electronics (formerly National Tower Company), PO Box 15417, Shawnee Mission, KS 66215. Telephone (800)762-5049, (913)888-8864. Web page is http://www.sound.net/~ne/

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411. Web page is http://www.aesham.com

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. By federal regulation, new scanner models cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/hamradio/mods directory at:

garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then

copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a warranted, modification for fee service.

For information on "virtual downconverter" modifications, see Steve Donnell's article in January 1995 RCMA Scanner Journal or February 1996 Monitoring Times. Reprints of articles from Monitoring Times are available for $3.00 each plus a self-addressed stamped envelope from:

Grove Enterprises,
7540 Highway 64 West,
Brasstown,
NC 28902. For a free catalog, call (828)837-9200.
Telephone (orders only): (800)438-8155.

I don't get any part of this reprint fee.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here is one company which repairs scanners:

- G & G Communications (telephone 716-768-8151) - (www.iinc.com/ggcomm or email ggcomm@iinc.com or ggcomm@aol.com) This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 7825 Black Street Rd., LeRoy, NY 14482.

Repair tips for Bearcat and Radio Shack scanners are discussed in two other FAQ articles.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Plus, published each year in 9 regional volumes by Hollins

Radio Data, and sold at Radio Shack and larger book stores. The newest editions contain abbreviated business listings, too, although callsigns and other details are listed only for local government and public safety licensees.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A 1100 page 3rd edition is now available. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 828-837-9200, www.grove.net) and the sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning (NatScan) is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. Early issues disappointed experienced scanner hobbyists, but it now has a good column on scanner modifications and has greatly improved its coverage of east coast frequencies since merging with NESN (North East Scanner News). The best scanner frequency

lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM for $100. In the 1995 edition, fields are different than PerCon's Spectrum CDROM but the data appears to be of the same vintage. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $5.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the

scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs or Mailing List?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

Peter Laws administers an electronic mail list read by over 700 hobbyists devoted to scanners and scanning. It's called "scan-l" and for more information, read:

http://www.wildstar.net/~plaws/scan/scan-l.txt

Clay Irving <clay@panix.com> administers a scanner electronic mailing list, called "scanning." To subscribe, send an Email message to: majordomo@lists.panix.com

In the body of the Email message, put: subscribe scanning

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. You can obtain an electronic subscription to the CARMA Newsletter. For more info, see:

http://www.TheRamp.net/shabec/carma.htm

The club's mailing address is:

CARMA
P.O. Box 2681
Glenview, IL 60025

All 1999 meetings (except August) will be held on Saturdays | at Phillies Pizza, 6300S. Kingery Highway, located in the | shopping center at the corner Rt. 83 and 53rd St. in | Willowbrook, IL,

The 1999 meeting schedule is: April 3, June 5 (picnic at | Argonne National Labs), August 7, October 2, and December | 4. |

The CARMA Picnic will be June 5th, 1999 at the Argonne |
National Labs Picnic Pavilion, Cass Avenue, south of I-55 |
in or around Darien or Lemont. The picnic will start |
whenever someone arrives. The regular meeting will be in |
the Pavilion at 1:00 PM. If the weather is totally |
frightful we also have a room inside the Laboratory |
building available for us. |

The Picnic is BYOE (Bring your own everything) If you want |
to eat or drink, bring it with you, as well as your BBQ or |
six pack.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner. The author writes a monthly "Scanner Equipment" column for Monitoring Times magazine, published by Grove Enterprises, but views expressed in this article are his own.]

I am often asked, "How do you find these frequencies?"
This article answers the question in various sections:

Books
Magazines
Government Records
Web Sites
Federal Radio Stations
Radio Clubs
Do Your Own Sleuthing
What Makes Station Identification Difficult?
Examine the FCC License on Premise
Examine the Labels on Radio Equipment
Examine the Antenna to Determine Frequency Band
Equipment to Determine Frequency Usage
How Can I Determine To Whom I'm Listening? - An Example
Summary
Addresses

Books

The most convenient source of fire and police frequencies is the Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and

larger book stores for under $13. Police Call Plus is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. A few pages of local airport and nonsensitive federal government frequencies are included. Selected business frequencies are listed, too, but without callsigns and other details.

I highly recommend Richard Barnett's book, Monitor America, published by Scanner Master Corp. A 3rd edition is available from Grove Enterprises for about $30. It is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the Radio Communications Monitoring Association (RCMA), now defunt. Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call Plus, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The longstanding source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It

is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and the sensationalistic Popular Communications magazines.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM for $49 instead.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100.

The PerCon Spectrum CDROM sells for under $30 and contains a handful of fields for every FCC license in the US. However, Public Safety license information contained in the Winter 1996 Spectrum doesn't appear as up to date as in the 1997 Police Call Plus.

Spectrum works in DOS, Windows, and Mac environments. One can try restricted sample searches of the Spectrum CD for free via PerCon's web page at

http://www.perconcorp.com/db_srch.htm .

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $5.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Web Sites

If you have access to the World Wide Web, you can visit dozens of sites with local frequency lists. You can look up civilian aero frequencies for specific airports at: http://www.airnav.com/airports/.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA). (See "The Government Giveth, the Government Taketh Away", by Richard Prelinger, in Monitoring Times, July 1982.)

Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'. (See "AFIO and the FOIA", by Bob Grove, in Monitoring Times, September 1982.)

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA), now out of business. There are several regional scanner clubs, spun off from the former RCMA, which hold regular meetings.

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available on the WWW page http://aosc.rpmdp.com and from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio,

or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at

the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

If you don't have a VOX recorder, consider a device like the NiteLogger II tape recorder controller, made by Benjamin Michael Industries. It connects simply between scanner and recorder and contains sound activation circuitry to trigger the recorder.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was

permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Examine the Antenna to Determine Frequency Band

You can often determine a transmitter's frequency band by the size and type of antenna used.

The Police Call Plus book contains sketches of antennas. Antenna catalogs are crammed full with antenna pictures and specifications and they are usually free. Contact Antenna Specialists (216-349-8400), Cushcraft (603-627-7877), Tessco (800-472-7373), Maxrad, Larsen Electronics (800-426-1656), and other companies in the land mobile equipment business.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and

store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi

antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET groups
rec.radio.scanner, alt.radio.scanner, and rec.radio.info.
It is also available electronically from the
rec.radio.scanner ftp archive on the official USENET FAQ
library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article discusses the purchase of used scanner radios
and includes these topics:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get
it fixed
3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. I purchase
most of my receivers at hamfests or horsetrade with other

radio hobbyists.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective. For hints on fixing older Bearcat base scanners, see "Tips for Fixing Bearcat Scanners," by Bob Parnass, AJ9S, in March 1996 Monitoring Times magazine.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Radio Shack repairs scanners, and Uniden can repair newer Bearcat models but often refuses to service older models, claiming they are "unrepairable" and carving the letter "U" on the cabinet.

G & G Communications (telephone 716-768-8151) is a family owned company which repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series (see US patent 4,011,515, granted 3/8/77). Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Tennelec MCP-1 (see US patent 3,961,261, granted 6/1/76), Bearcat BC-101 (see US patent 4,179,662, granted 8/4/78), and Radio Shack COMP 100, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. See US patent 4,057,760, granted 11/8/77. The GRE-manufactured SBE Optiscan (and its Sears clone) required poking or covering a series of holes in

plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. Until the mid 1980s, rivals Regency and Electra (Bearcat) built most of the scanners in their Indiana and Puerto Rican factories. Uniden, a large Japanese electronics company, purchased the scanner product lines of both competitors and moved production to Asia.

My favorite VHF/UHF receivers are the the Uniden/Bearcat BC9000XLT, the 400 channel Radio Shack PRO-2005 and PRO-2006, and the ICOM R7000, R7100, and R8500. The ICOM models are more "communications receiver" than a conventional scanner.

For portable use, I prefer Uniden/Bearcat BC3000XLT and older Radio Shack PRO-43.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to

cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

Electra Corporation stocks crystals for the Bearcat scanners:

Electra Corporation
11915 E. Washington St.
Cumberland, IN 46229
Phone 317-894-3229

Crystals for Bearcat and other models are available from:

American Crystal Co.

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993 - 1999 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

The original Bearcat scanner line was manufactured by
Electra Company, a division of Masco Corp of Indiana. In
the mid 1980s, Uniden, a Japanese company, bought out the
Bearcat scanner line and Uniden's first Bearcat scanner was
the BC800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s although some of the capacitor failures occur in the
Uniden BC800XLT, too.

Electra stamped all of its scanners with a manufacturing
date code on the rear of the cabinet. The code is comprised
of a single character (C = Cumberland, Indiana, P = Puerto
Rico), followed by four digits denoting year and week the
radio was built. For example, "P8422" denotes the radio was
made in the Puerto Rico factory during the 22nd week of
1984.

One way to roughly estimate a radio's age is to examine the
4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most

recent date stamp.

Schematics, Owner's Manuals, and Parts Available

The re-incorporated Electra Corporation is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 11915 E. Washington St., Cumberland, IN 46229. Phone 317-894-3229.

I cannot furnish schematics, manuals or parts. To order a user manual for an Electra/Bearcat scanner from Uniden, call (800)235-3874 extension 2553. You can also download an electronic copy of the user manual for recent Bearcat models from the Uniden web site:

http://www.uniden.com/docs/service/support.htm

Some schematic diagrams may be obtained from Uniden's parts department, (800)297-1023. Uniden currently charges a flat rate of $54 for scanner repairs. They will repair and return "out of warranty" items without an estimate unless the repair charges exceed the flat rate charges.

The phone number for repair is (800)297-1023, too. I recommend you call repair before sending the broken scanner. Items for repair via UPS (include receipt if still under warranty) are usually sent to:

Uniden America Corp.
4700 Amon Carter Blvd.
P.O. Box 95002
Fort Worth, TX 76155

If Uniden doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.hwsams.com/sams_model_new.html

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

Common Construction

Most of the classic, metal-cased Bearcat base/mobile models were built using two printed circuit boards:

1. a "radio board" containing the synthesizer, RF, IF, and audio stages, and

2. a "feature board" containing the microprocessor controller and memory circuitry which gave each model its own personality.

Although there are various vintage radios boards, they all have similar circuitry.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Matt Roberds fixed a BC220 which experienced memory loss if power was removed by resoldering the positive wire to 2-AA battery holder.

As built, the BC220 logic board is grounded only through its mounting screws. In the BC220, Matt recommends adding real wire ground jumpers from the main board to the feature (logic) board to fix grounding problems.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. See March 1996 Monitoring Times magazine for BC800XLT capacitor locations and repair information.

The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

Jim Craig replaced a 22uF/35V C98 capacitor to repair his BC210XW.

Paul Grohe replaced a failed C98 with a low ESR (equivalent series resistance), high frequency, switching regulator grade capacitor, e.g. a Panasonic HF series capacitor. He also recommends adding a 0.1 ceramic capacitor in parallel with C98.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Failure of IC9, the 9 volt NJM78M09A regulator in a BC800XLT is another cause of a blank display.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This condition is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of

a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Matt Roberds repaired the Montgomery Wards version of a BC220 and contributed these insights:

"I did add some heat-sinks, but you have to be careful what you do with the TIP29 on the logic board. I added a long, flat heatsink to it and immediately created a whine in the audio. I didn't use an insulator, as this was a temporary first-try. As far as I can tell, the heatsink was radiating noise from the logic board into the front end on the radio board, which ended up being just below the heatsink. Bypassing the TIP29 (a voltage regulator) with disc ceramics didn't work; using a smaller heatsink and an insulator fixed the problem."

"There is also a 220 ohm 1/4 watt resistor on the logic board. It feeds the TIP29 from the main +16v supply. It looked a little crispy. I pulled one end and measured the current through it and it was about 30-35 mA. This works out to right at 0.2-0.25 watt dissipation. I didn't have a higher-wattage resistor, so I substituted 2 470-ohm resistors in parallel."

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Uniden/Bearcat BC200XLT Portable
Loss of Audio and Dial Lamp

If you can program frequencies into your BC200XLT but there is no audio and the green backlight no longer functions, a tiny transistor may have failed.

Check for a defective PNP surface mount transistor, Q201 (2SB815B6-YDY). Q201 is used as a switch to furnish 8 VDC to several stages of the BC200XLT. Its main purpose is to

switch off power hungry stages of the BC200XLT when the CPU thinks the NiCd voltage has fallen below a threshhold. That's an attempt to limit the current drain on weak NiCds to avoid permanent damage.

Q201 is located on the foil side of the "Micom" board, adjacent to the black multi-pin connector which mates the Micom and main boards together.

Q201 can be destroyed by a few different causes, primarily, by something in the scanner drawing too much current through it. In one case, capacitor C36 shorted. It's a 220 uF 10v electrolytic, located on the component side of the main board, connected from pin 8 of the audio IC (IC2 NJM386SL) to ground. Capacitor C55 shorted in another BC200XLT. Gary Bean reports he substituted a 2SA1298 for Q201 and it worked fine. In a pinch you bypass Q201 by soldering a short piece of bare wire between the collector and emitter, but you must first fix the component which caused Q201 to fail.

BC9000XLT: Loss of Sensitivity

John Ward has fixed two BC9000XLTs which suffered from "low sensitivity." He fixed the solder joint where the antenna jack connects to the circuit board. In both cases the tab from the board was on the opposite side of the jack from where the little blob of solder applied at the factory was located.

It was an intermittent problem that depended upon the position of the antenna cable - if the weight of the cable placed tension on the jack in one direction contact was made and the radio worked fine. If the cable placed tension on the jack in the opposite direction contact was lost and so was reception. The gap was barely noticeable.

Other Problems

Complaints of low audio output and occasional microphonics in three Uniden/Bearcat 800XLTs were caused by a bad 47 ufd electrolytic capacitor in series between the external speaker jack and audio amplifier.

Andy Domonkos reports he often uses a tape recorder connected to a Uniden/Bearcat BC890XLT. RL-1, the carrier activated relay inside the BC890XLT wore out. Andy found the identical relay sold at Radio Shack (part #275-232) and says the BC9000XLT uses the same relay, too.

Replacement Bulbs for BC760XLT

The Uniden BC760XLT's SCAN, MAN, PRI, and HOLD buttons are illuminated by "grain of wheat" type incandescent bulbs. Gary Saffer reports that the bulbs and buttons are located on a small printed circuit board which sits behind the radio's face plate. Gary unsoldered the burned out bulbs in his radio and replaced them with 12 volt Radio Shack bulbs (#272-1092c). They should last a long time when powered by the 8 VDC supplied by the BC760XLT.

Open Resistor in BC140

Robert Casey fixed his deaf, 16 channel Bearcat BC140 scanner. A 10 ohm resistor had opened that fed a circuit that generates 22V for the varactor diode tuner circuits. Without the 22V, there was no tuning of the local oscillator and front end, and no reception. What he did was compare voltages to a second working BC140.

Sources for Replacement NiCd Battery Packs

Replacement NiCd battery packs and inserts for the BC100XLT, BC200XLT, BC2500XLT, BC3000XLT, and other scanners are available from Uniden. I've purchased them at lower cost from:

1. Mr. NiCd - E. H. Yost and Company, 2211-D Parview Rd., Middleton, WI 53562. tel. (608)831-3443. email ehyost@midplains.net

2. Battery-Tech Central, 2818 Southland Street SW, Cedar Rapids, IA 52404-4141. tel. (800)267-3087 or (319)364-0855. email rlassoc@inav.net

Batteries Plus has stores across they country and some have rebuilt Uniden NiCd packs for under $20.

HAMFEST/COMPUTERFEST CALENDAR 1999 - NORTHERN ILLINOIS
last updated February 3, 1999 |

o Please report additions or changes to Bob Parnass, AJ9S, office phone: (630)979-5414, electronic mail: parnass@bell-labs.com. Thanks to Dennis Dale, Rick D. Wilson, Tom Harker, and ARRL for providing some of the information.

FEBRUARY 1999

Feb 7 (Sun), Wheaton, IL - Giant Computer show (see below). Dupage County Fairgrounds.

Feb 14 (Sun), Rock Island, IL - Davenport ARC. QCCA Expo Center, 2621-4th Ave., Rock Island. 7:30 AM - 3:30 PM. Talk in 146.88 and 146.64 MHz. info: Kent Williams, K9UQI, 4245 10th St., East Moline, IL 61244-4154. tel. 309-796-0718. Fax: 309-796-0629. E-mail: k9uqi@arcsupport.com. http://www.arcsupport.com/drac

Feb 14 (Sun), Orland Park, IL Giant Computer Show & Sale (see below). orland Park Civic Center.

MARCH 1999

Mar 7 (Sun), Wheaton, IL - Giant Computer show (see below). Dupage County Fairgrounds.

Mar 7 (Sun) - Waukesha, WI. SEWFARS Swapfest. Info: Mary J. Adams, KB9IFF, tel. 414-358-1003. E-mail: mjadams@execpc.com.

March 14 (Sun): Sterling-Rock Falls ARS, Sterling, IL info: Lloyd Sherman, KB9APW, PO Box 521, Sterling, IL 61081-0521. tel. 815-336-2434, E-mail: lsherman@essexl.com

March 28 (Sun): Grayslake, IL - LAMARS hamfest, Lake County | fairgrounds. All indoors. Admission $6 at gate, free park- | ing. Setup at 6 AM, doors open at 8 AM. Info: tel. 847- | 272-8347. See | http://www.lightwriters.com/nsrc/lamarsfest.htm | (Small fest, but usually interesting - AJ9S.)

APRIL 1999

April 11 (Sun): Middleton, WI. Madison Area Repeater Association. 8 AM - 1 PM Middleton Conference Center, 1313 John Q. Hammons Drive Middleton, WI 53562. The Middleton Conference Center is located in Middleton, WI, near the west side of Madison, WI. From the intersection of Interstate 90 and Highways 12 and 18 near Madison's South-East corner, take Highway 12 West. Stay on Highway 12 until you reach Greenway Blvd. Exit to Greenway Blvd. and turn left. Then turn left on John Q. Hammons Drive. The Conference Center is attached to the Marriot which is clearly visible from the intersection of Highway 12 and Greenway Blvd. Talk-in Frequency: 147.75/.15. Info: Paul Toussaint, N9VWH, MARA President, prt@execpc.com. The MARA telephone voice mail (608)245-8890 . http://skywarn.ssec.wisc.edu/mara/swapfest

Apr 17 (Sat), Wheaton, IL - Giant Computer show (see below). | Dupage County Fairgrounds.

Apr 18 (Sun), Orland Park, IL Giant Computer Show & Sale | (see below). orland Park Civic Center. |

April 25 (Sun): Galva, IL. Area Amateur Radio Operators Hamfest. When: 8 am until 2pm, April 25, 1999. Where: The National Guard Armory Tickets: Advance tickets $5 double stubs, at the door $5 single stub, No advance sales after March 25th. Outside flea market space available. Electricity, available on a first come first serve basis. Bring your own extension cords. VE Testing will be available by appointment only. Talk in 145.4900 - 88.5 PL / 146.460 simplex. Breakfast and Lunch will be available and served by the National Guard Relief Members. For set up times, advance ticket sales or other information, contact: (1) Bill Anderson WB9TEW, 103 SE 2nd Ave. Galva, Illinois 61434-1854. tel. 309-932-3023, bill@inw.net. (2) Tom Davis N9OSP, 802 Rose Street, Kewanee, Illinois 61443. Tdn9osp@cin.net

April ?? (Sun): Stickney, IL. Dupage Amateur Radio Club, Hawthorne Race Course. Hours 8 AM - 2 PM. Setup 6 AM.

AUGUST 1999

Aug 29 (Sun), Woodstock, IL. Tri-County Radio Group. McHenry County fairgrounds. Talk-in: 146.52 Simplex. info: Bob Grosse, N9KXG, PO Box 3107, Skokie, IL 60077-6107 E-mail: tcrg@hotmail.com, http://quality-enterprises.com/tcrg/. Tickets: Advance With Double Stub $4.00 - At Gate $5.00 Single Stub - $6.00 With Double Stub . Exhibit Building: 8:00 A.M. - 3:00 P.M. Table Rental: $14.00 For 8' Table. Flea Market: 6:00 A.M. - 3:00 P.M. No Additional Charge For Flea Market Space Info (708) 944-0500. Fax (847) 658-1678. (fairly good, small to mid sized hamfest - AJ9S).

COMPUTER SHOW NOTES

Computer Central computer shows are held at the College of DuPage, Main Arena of the Physical Education Building Park Blvd & College Road, Glen Ellyn, Il. 847-940-7547. $5 admission with card, normal admission $6.00. Opens 9:30 am - 3:00 pm. See http://www.computercentralshows.com web site.

Giant Computer shows are held by Micro Media, Inc. Shows are usually held at the Orland Park Civic Center, 147th St. & LaGrange Rd., Orland Park, IL or at the DuPage County Fairgrounds, County Farm & Manchester Rds., Wheaton, IL. Admission is $6. Show hours are 9:30 AM - 3 PM. To get on the mailing list or get more information, call (708)974-3123. See http://www.giantcomputershow.com

Computer Country Expo is Lake County's largest computer expo. The event is held on designated Saturdays from 9:30 AM to 3:00 PM. This show features computers, supplies, games, parts, software, accessories, CD-ROM, monitors, diskettes, printers, keyboards, modems, disk drives, cables, expansion boards, services, and anything else in the domain of computers! Lake County Fairgrounds, Route 120 (Belvidere Rd.) & Route 45, in Main Exhibit Hall Building #1=9720,000 sq. feet of everything Computer! For a show map, exhibitor info, and discount coupon, visit the web site at http://www.ccxpo.com.

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

In the 1960s and 1970s, thousands of firemen and ambulance
squad members came to rely on their crystal controlled,
transistor Plectron and Motorola desktop monitor receivers.
They have now been replaced by battery operated portable
pagers, and the desktop models are often available at
hamfests in the $5 - $25 range. Since many are in rough
condition and need repair, a hamfest special is better
suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are
excellent for dedicated monitoring of local frequencies --
a task for which you wouldn't want to tie up your 400
channel programmable scanner. They are desktop models
which can be powered from 117VAC or 12VDC with the proper
mobile cord. The audio quality of a Plectron P1, Plectron
700 series, and Motorola Alert Monitor is far better than
any consumer grade scanner and the sensitivity, image
rejection, and intermod immunity is outstanding when
aligned properly.

Models and Frequency Coverage

The Plectron and Motorola Alert monitors are single band
receivers: VHF-low, VHF-high, or UHF. No single Plectron
or Motorola Alert monitor can cover the entire 30-50 MHz

band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the 700 and R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal

scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

30-54 R8190 R8150
148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Crystals

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

The best source for crystals is:

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

You need not bother with calculating the crystal fundamental frequency. Merely supply International with the exact receiver model number, printed on the rear label,

and the frequency you want to monitor. They will perform
the necessary calculations.

Crystals for Plectrons

The Plectron P1 series contain two crystals. The second
local oscillator crystal is 11.155 MHz regardless of band.
On VHF high band (148 - 175 MHz), the P1 series employ this
formula for the first local oscillator crystal:

Crystal frequency (MHz)
= (station freq (MHz) + 10.7) / 4

or

Crystal frequency (MHz)
= (station freq (MHz) - 10.7) / 4

On VHF low band (25 - 54 MHz), the P1 series employ this
formula for the first local oscillator crystal:

Crystal frequency (MHz) = (station freq (MHz) + 10.7)

or

Crystal frequency (MHz) = (station freq (MHz) - 10.7)

There are two crystals (Y1, Y2) used in the Plectron R700
series, one for each local oscillator. The crystal
formulas are:

RF Range (MHz) Y1 (MHz) Y2 (MHz)
_____
25-29 (f+10.7)/3 11.155
29-32.6 (f+10.7)/3 11.155
32.5-35 (f-10.7)/2 10.245
35-41 (f-10.7)/2 11.155
41-47 (f-10.7)/2 11.155 (use 10.245 MHz
for Y2 on 44.62 MHz)
47-54 (f-10.7)/3 11.155
148-158 (f-10.7)/9 11.155
158-175 (f-10.7)/9 10.245
450-470 (f-10.7)/18 11.155

The economy Plectron 500 series use this scheme for the
first local oscillator crystal:

RF Range (MHz) Crystal (MHz)
_____
25 - 35 (f+10.7)
35 - 54 (f-10.7)
148 - 174 (f-10.7)/4

Most Plectron 500s use an 11.155 MHz second local
oscillator crystal. However, a 10.245 MHz crystal is used

instead for receivers in these ranges: 33.4 - 33.78, 44.62, and 158.78 - 158.82 MHz.

Power Cords

AC power cords for both types of receivers use unique connectors and are scarce. I published the pinout for both Plectron and Motorola Alert Monitor receivers in June 1998 Monitoring Times magazine.

You can buy the proper replacement power cords but it's much cheaper to drill a hole on the rear panel and solder on a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

Squelch and Minimum Volume Setting

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Both Plectron and Motorola Alert monitor receivers are designed purposely to have a minimum volume setting which is still audible. The intent was to prevent firemen from turning the volume down completely, forgetting it was down, then missing an important call.

This "feature" was usually implemented by having a fixed value resistor in series between one end of the volume control and ground. In the R15X5, R14X5, R15X5, and R16X5, a 47 ohm resistor, designated R624, was inserted in series with the violet wire leading from the volume control.

You could decrease the lowest volume setting by decreasing the value of this fixed resistor. Alternatively, you could replace the resistor with a jumper wire to completely silence the receiver at minimum setting of the volume control.

Tone Alert Feature

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on

the tone frequencies and are somewhat difficult to obtain.

Repair and Replacement Parts

Repair service and replacement parts for the Plectron P1 and R700 models is offered by:

Weber Electronics
PO Box 212
5138 Laurel Ln.
Broad Run, VA 20137
telephone (540) 347-7760
email: weber@citizen.infi.net

You can also obtain Plectron repairs and parts from:

Northeast Communications
4 Oak Ridge Rd
Newfoundland NJ 07435
201-697-8804

Alert Monitor parts are available from Motorola. Phone (800)972-3226.

Plectron SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and feature priority scan and a separate trimmer capacitor for each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model UHF VHF-high VHF-low

SM-301 X X X
SM-302 X X
SM-303 X X
SM-304 X X

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from the crystals used in the conventional single channel Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) /
10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

Plectron Alternatives

Too bad Plectron is out of business. If you wish to
purchase a new receiver with "Plectron-like" signaling
capabilities, contact Reach Electronics:

Reach Electronics
1311 West Pacific
Lexington, NE 68850
(308) 324-6661
(800) 445-0007
FAX: (308) 324-4985

Reach sells tone & voice pagers, Alert monitors, and
ENCODERS. They also do contract manufacturing.

I currently have no Plectrons or Motorola Alert Monitors
for sale. I'm hoarding them. :-)

REPAIR TIPS: RADIO SHACK SCANNER RADIOS

Copyright 1997 - 1999 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

Radio Shack has been selling scanners and monitor receivers
under the Realistic and Radio Shack labels for over 30
years. Most of them were manufactured by General Research
Electronics of Tokyo, though many newer models are
manufactured by Uniden.

The date of manufacture is usually printed on a gummed
label on the scanner as well as the cardboard box. A code
of 12A5, means the scanner was made in the 12th month of
1975, 1985, or 1995, for example.

There's another way to date Radio Shack scanners
manufactured by Uniden. The first digit of the long serial
number is usually the last digit of the year of
manufacture.

Another way to roughly estimate a radio's age is to examine
the 4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most
recent date stamp.

Schematics, Owner's Manuals, and Parts Available

I cannot furnish schematics, manuals or parts. Service manuals for most Radio Shack scanners sold through mid-1997 may be ordered through your local Radio Shack store.

If Radio Shack doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.hwsams.com/sams_model_new.html

Parts lists for recent and many older models are available on line at: http://support.tandy.com. Parts may be ordered through Tandy National Parts, telephone (800)442-2425 or (817)870-5600, or through your local Radio Shack store

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

GRE-Built Base Models: Dim Backlight

The backlight in many base models, including the PRO-2022, PRO-2004, and PRO-2005/6 is implemented by an electroluminescent panel, which grows dim with use.

The EL panel used in the PRO-2005 and PRO-2006 is designated EL-501, and is identified by Radio Shack part #10800050. A new EL panel can be ordered through your Tandy National parts (see above) or local Radio Shack store and sent to your home. Radio Shack no longer sells replacement EL panels for the PRO-2004.

Replacing the backlight is an operation which requires care and patience. Purchase a service manual, and study the exploded parts diagrams as you read the following steps.

Top and bottom cabinet pieces must be removed, then the speaker unplugged from the main board. The front panel assembly must be removed from the chassis by removing 4 flat head screws, 2 on each side. You need not disconnect all the wiring harnesses, though you might have to unplug one so it won't get in the way of a hot soldering iron.

Unsolder the bare ground wire soldered to a large shield on the back of the front panel, located near the back of the squelch control. Two ground braids must be temporarily disconnected by removing the screws which fasten them to the chassis. After removing the volume and squelch knobs, you must remove 8 small screws which fasten the plastic front panel to the diplay board.

The old EL panel is fastened by a bead of glue and two foil type leads soldered to the display board. It's easier to cut the two leads from the old EL panel before unsoldering. A sharp knife should be used cut away the glue. The old EL panel can then be slid gently out from behind the LCD display.

The new EL panel can be installed by reversing the process, though I found that it is not necessary to glue the new panel. The two foil leads must be soldered using a minimum of heat. Reassemble the pieces in reverse order of disassembly.

GRE-Built Portables: Worn Out Keypads

The keypad on late model GRE-made Radio Shack portables, e.g., PRO-39 and PRO-43, can become unreliable after prolonged use. The best repair is to replace the rubber keypad instead of trying to restore contacts using chemicals. A replacement rubber keypad may be ordered inexpensively through Tandy National Parts or your local Radio Shack Store.

PRO-43: Loss of Audio

Early PRO-43s were built with a 200 mW speaker (mfr's part #EAS-3P123A). The voice coils in some of these speakers have opened, resulting in lack of audio output, though audio is still available from the earphone jack. A more capable 500 mW speaker is available through Tandy as replacement (EAS-3P127).

PRO-43: Freezup

If you attempt to lock out all 20 channels in a memory bank, then scan only that bank, your PRO-43 will freeze up and be placed into a catatonic state. Use the procedure documented in the PRO-43 user manual to fully reset the scanner. This will "break the trance," but all the memory channels will be cleared.

PRO-2004: Dead

If your PRO-2004 is completely dead, check R235, a 1 ohm, 1 watt resistor mounted vertically on the main board.

PRO-7A: Channels 1 - 4 or 5 - 8 Dead

If the first or last 4 channels in your 8 channel PRO-7A crystal scanner are not working and the lamps for those channels won't light, replace IC4 or IC5 (type 7400A).

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

Copyright 1988 - 1999 by Bob Parnass, AJ9S

[NOTE: The first version of this article appeared in the RCMA Newsletter, December 1988. It may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, sci.electronics.repair, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

The squelch control in some FM monitor receivers is difficult to use because of too much hysteresis. The American Heritage Dictionary of the English Language defines hysteresis as the:

o "Failure of a property changed by an external agent to return to its original value when the cause of the change is removed."

It's like having play in a car's steering wheel, or backlash in a gear set. Too much hysteresis in a squelch circuit forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The squelch hysteresis problem was first addressed in a 1984 article about the Radio Shack PRO-24 crystal controlled scanner.

Why do engineers design these circuits with any hysteresis? Basically, hysteresis prevents weak signals from "popping" the squelch open and closed rapidly, which would be very annoying to the listener. A squelch circuit with hysteresis requires a stronger signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003, PRO-2004, and others. Don't despair, the fix is simple for most radios. I've successfully reduced the squelch hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as identified in the table below.

This technique does not apply to some of the newer Uniden models, because the squelch hysteresis is partially determined by firmware inside the processor IC.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

4. If space permits, you can replace the stock resistor with a higher value variable resistor ("trimpot") and adjust to suit.

Table 1. Squelch Hysteresis Resistor In Selected Receivers

Squelch Hysteresis Resistor In Selected Receivers		
Receiver Model No.	Res-istor Value	Stock Comments
Radio Shack PRO-24	R35	33K replace with 220K. Located between pins 12 and 14

	of MC3357 (IC1)
Radio Shack PRO-2002	R197 47K try 220K.
Radio Shack PRO-2004	R148 47K remove R148
	or replace with 220K.
	On linear board,
	between pins 12 & 14
	of TK10420 (IC2)
Radio Shack PRO-2006	R152 33K try 100K or higher.
Radio Shack PRO-2022	R91 33K replace 33K
	with 220K.
	Between pins 12 & 14

SCANNER RADIO REVIEW BRIEFS

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

Abstract

This article contains product review summaries for more than 70 old and new scanner radios and monitor receivers.

The author writes a monthly "Scanner Equipment" column for Monitoring Times magazine, published by Grove Enterprises, but views expressed in this article are his own.

Introduction

At last count, there were over 140 scanners and monitor receivers of various brands in my collection. This article describes a few of the FM receivers in my collection, and other models I've tested. It is not meant to be complete.

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass, Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass, Monitoring Times, May 1995.

I have published full length reviews and modifications of these scanner models in Monitoring Times magazine:

Mar 1986 - Uniden/Bearcat BC800XLT
Mar 1987 - Radio Shack PRO-2004

Oct 1990 - Radio Shack PRO-2006
Jan 1995 - Radio Shack PRO-2035 vs. Radio Shack PRO-2006
Feb 1995 - Radio Shack PRO-62 Portable
Mar 1995 - Uniden/Bearcat BC9000XLT
Apr 1995 - Uniden/Bearcat BC3000XLT Portable
May 1995 - Uniden/Bearcat BC860XLT
Jun 1995 - Uniden/Bearcat BC890XLT & Radio Shack PRO-2036
Jul 1995 - Radio Shack PRO-2037
Aug 1995 - Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT
Sep 1995 - Radio Shack PRO-60 Portable
Oct 1995 - AOR AR-2700 Portable
Nov 1995 - selected AOR AR-8000 measurements
Dec 1995 - Radio Shack PRO-2040
Jan 1996 - Plectron & Motorola Alert Monitors
Feb 1996 - Radio Shack PRO-2042
Mar 1996 - Tips for Fixing Bearcat Scanners
May 1996 - Compendium of Scanner IFs
Apr 1996 - Uniden/Bearcat BC220XLT, BC230XLT Portable
Jun 1996 - modifications & tips for the Uniden/Bearcat BC9000XLT
Jul 1996 - Uniden/Bearcat BCT-10 mobile
Aug 1996 - BMI Nitelogger II tape recorder activator
Sep 1996 - PRO-2022 modifications
PRO-2042 baseband audio tap
Oct 1996 - Radio Shack PRO-2046 mobile
Nov 1996 - Build a wooden mobile radio mount
Dec 1996 - AOR AR5000
Jan 1997 - ICOM R8500
Feb 1997 - Radio Shack PRO-2045
Mar 1997 - ICOM IC-R10
Apr 1997 - RELM HS-200 portable
May 1997 - Uniden/Bearcat BCT7 virtual downconversion mod.
Jun 1997 - Innovative Scanner Patents of the 1970s
Jul 1997 - Uniden/Bearcat BC235XLT portable Trunktracker
Aug 1997 - Radio Shack PRO-64 portable
Sep 1997 - Stridsberg Engineering receiver multicoupler,
G/Wiz board for EDACS trunked scanning
Oct 1997 - Radio Shack PRO-67
Nov 1997 - Sporty's JD-100 Air Scan
Dec 1997 - Uniden/Bearcat BC895XLT Trunktracker
Jan 1998 - Test Equipment Bargains
Feb 1998 - Innovative Scanner Patents of the 1980s and Beyond
Mar 1998 - RELM MS-200 mobile
Apr 1998 - RCA RP-6150 portable
May 1998 - Radio Shack PRO-2050 base Trunktracker
Jun 1998 - Opto DC442 CTCSS/DCS/DTMF display
Jul 1998 - Stub and Par Electronics intermod rejection filters
Aug 1998 - Sony SC1PC portable
Sep 1998 - Orange Book of Scanner Repair
Tone Out Testing (2-tone generators)
Monitoring ACSB (amplitude compandored side band)

Oct 1998 - AOR AR8200 portable
Nov 1998 - Alinco DJ-X10T portable
Dec 1998 - Radio Shack PRO-91 portable Trunktracker
Jan 1999 - AOR AR7000
Feb 1999 - Radio Shack PRO-2066 mobile Trunktracker
Mar 1999 - ICOM RS-8500 software for controlling the IC-R8500 |

Note: Reprints of Monitoring Times articles are available for $3.00 each plus a self-addressed stamped envelope from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902, tel. (800)438-8155. I don't receive any part of this reprint fee.

ALINCO

DJ-X10T: 1998 vintage. Rugged construction - metal back. Multimode frequency coverage 0.1 to 2000 MHz (minus cellular bands). 20 selectable step sizes from 0.05 to 500 kHz. Knob atop the radio clicks when rotated and serves as a VFO knob, channel selector, and menu navigation control. Several battery pack options for NiCd and alkaline battery cases. Furnished with an EBP-37N 4.8 V, 700 mAH NiCd pack and a sturdy 11 hour drop in charging stand. Loaded with firmware features and complicated to use. Two VFOs and 1200 channels in 30 banks of 40 channels each. Memory banks are cryptically designated, though you can scan combinations of banks. Each memory channel can be programmed with the frequency, an 8 character label, attenuator, a skip (lockout) flag, and mode (WFM, NFM, AM, USB, LSB, CW, AUTO). Very slow 6 ch/sec scan rate. Rescan delay is about 1 second and cannot be disabled or changed. Auto Memory Write stores up to 40 frequencies but does not check for dupes. 20 linkable search banks with labels. Up to 50 frequencies per search bank can be locked out. Digital clock with on/off timer. Battery saver can be disabled. Ability to scan or search for signals above a selectable threshold or channels with a specific mode. Band scope 7 or 40 steps wide. In short, 30 - 1000 MHz sensitivity is good, few birdies and little intermod. WFM broadcast reception very good. The DJ-X10T squelch can be set to one of 10 levels. We had to keep the squelch set to SQ3 or higher, otherwise it opens at inappropriate times, especially when the battery saver is active. The DJ-X10T instruction manual does not specify the IF (intermediate frequency) scheme. Filters inside the DJ-X10T imply 0.455, 10.7, and 45 MHz IFs. Our tests indicate a first IF of 736.25 or 275.45 MHz, depending on the frequency to which the DJ-X10T is tuned. Our DJ-X10T hears images of cellular phone signals clearly in the 1419.9 - 1444.9 MHz range, 550.9 MHz above their actual frequency. For a full review, including technical test results, see Monitoring Times, November 1998.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest. IFs are 287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, October and November 1995.

AR5000: 1996 vintage. approx. 30 kHz - 2600 MHz coverage super receiver. Good sensitivity throughout. AM, SSB, CW, FM detectors. Frequency readout to 1 Hz. More features than any other radio. DTMF reader and RS-232 interface included. Multiple settings for IF and AF selectivity, attenuator, AGC, deemphasis, etc. DB9 RS232C connector. Negatives include low contrast LCD display and difficult user interface. NFM squelch closes slowly, causing noise burst at end of each NFM transmission. Electromechanical relays click at various frequency boundaries, including 400 MHz, producing a clickety-clack noise -- annoying while scanning banks of mixed band frequencies. Great radio, otherwise. See "AOR's AR5000 All-in-One Receiver," by Bob Parnass, in Monitoring Times, December 1996, for a review which includes quantitative test results.

AR8200: 1998 vintage. S/N 550004 tested. Portable, high end "super" scanner covers 0.1 - 2040 MHz (minus cellular in USA version). Not a scanner for beginners. Many of the settings are made through the use of menus. Lots of features. 4 AA batteries, steel belt clip, plug-in AM antenna. 1,000 conventional channels in 20 banks, 10 temporary channels, one priority channel. Each memory channel may be programmed with frequency, label, mode, step, step-adjust, offset, attenuator enable, noise limiter, AFC, and write protect. Multi bank scanning. You can enable a 0 - 9 second rescan delay with each scan group, but not per channel. 40 pairs of search limits with labels. Offset capability for monitoring repeater input frequency. LCD display easy to read. Display and keypad backlit using green LEDs. The band scope. Shortwave reception stone deaf on shortwave when fitted with the supplied antenna or a 19" whip. Seriously overloaded on shortwave by a 132 foot long dipole unless we use the built-in attenuator. Supplied "dorsal fin" antenna for AM BCB. Scans slowly (14 channels/s). Requires more current. Audio quality is

slightly above other portable scanners. Computer port. One slot for a single plug-in option: voice inversion descrambler, CTCSS search, 256 frequency tone eliminator, voice recorder and playback, or extended (slow) memory. See AOR AR8200 review by Bob Parnass,in Monitoring Times, October 1998, for review with quantitative test results.

ICOM

IC-R10: late 1996 vintage (serial number 01048 tested). | Shirt pocket size multimode is powered by 4 AA penlight cells. Covers 0.5 to 1300 MHz (minus cellular). NFM, WFM, USB, LSB, AM, and CW detectors included. IF bandwidths are fixed. No 30 kHz bandwidth for satellite or FM military monitoring. Battery saver circuit, with selectable duty cycle. Single VFO and 1000 memory channels. There are 900 memory channels divided into 18 banks of 50 channels each. Another bank of 100 channels used to hold unique frequencies found during an auto store operation. 20 pairs of search limits. Up to 100 frequencies may be locked out during a search and stored in a final bank of 100 channels which is cleared before subsequent auto store searches. Each channel can be programmed with the detector mode (e.g., AM, USB), a tuning step size, an attenuator enable flag, and an 8 character label. CI-V computer interface requires extra cost hardware. 7 segment S-meter. Noise blanker. Good sensitivity. Lighted keypad and display, but keystroke sequences are cumbersome.

Good radio hardware in a handy sized package, but scanning performance unimpressive. Very slow memory scanning at only 6 channels/second. Searches at about 16 steps/second, with little or no worthwhile improvement using the "Signal Navigator" feature in the R10 I tested. Rescan delay cannot be disabled. Can only scan one memory bank or all banks, not a combination of banks. No squelch for SSB or CW modes. See "ICOM IC-R10 Receiver," by Bob Parnass, in Monitoring Times, March 1997, for review which includes quantitative test results.

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new

frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the ICOM user with a very annoying clickety-clack, clickety-clack! For Baseband Audio out, I mounted an RCA jack on the back of the R7100A and connected it via shielded cable to the junction of resistors R228 and R230 on the Main Unit. This point is located in the vicinity of IC15 and X3 on the schematic.

R8500: 1996 vintage. 100 kHz - 2000 MHz coverage. 20 banks of 40 channels although bank sizes can be changed. 100 Auto store and 100 Skip memories but that can be increased by reallocating channels from the conventional scan banks. Fixed and programmable step sizes. Relays clickey-clack while scanning across band boundaries. Triple conversion, First IF is 48.8, 778.7, or 266.7 MHz, depending on band. Second and third IFs are 10.7 and 0.455 MHz. Weak to moderate cellular images starting near 1106 MHz. Rugged construction. External power supply. DB25 RS232C connector. Audio peak filter. Ok scanning and great searching performance. See "ICOM R8500 Receiver," by Bob Parnass, in Monitoring Times, January 1997, for a review which includes quantitative test results.

UNIDEN/BEARCAT AND ELECTRA/BEARCAT

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency

of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC210 (Electra): 1979 vintage. First Bearcat scanner with a keyboard and numeric display. LED readout. See US patents 4,092,594, granted 5/30/78 and 4,114,103, granted 9/12/78 for further insight.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. See US patent 4,270,217, granted May 26, 1981. LED readout. Good scanner, but tinny audio.

BC220XLT (Uniden): 1995 vintage. Very good 200 portable scanner which is a smaller successor to the BC200XLT. Includes 800 MHz band. 10 priority channels. Service Search, including WX. Up to 10 frequencies can be locked out during conventional search, 20 frequencies from Service Search. Unique feature tells whether a given frequency has already been memorized. 10.8 MHz and 450 kHz IFs, with images 21.6 MHz away. 4 cell BP-120 internal NiCd battery pack. Marketed as BC230XLT with two BP-120 battery packs and CRX-120 dual charger. See "The BC220XLT/BC230XLT Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1996.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC230XLT (Uniden): See BC220XLT.

BC235XLT TrunkTracker(Uniden): 1997 vintage. Portable with 300 channels in 10 banks. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. A query feature identifies duplicate memory channels. Very fast scan and search rates. Scans 64 channels/sec and skips empty channels. Service search. Data skip. Triple conversion, 254.4, 10.85, 0.45 MHz IFs. Excellent image rejection and intermod immunity. Fairly good audio. See "The Uniden Bearcat BC235XLT," by Bob Parnass, AJ9S, in Monitoring Times, July 1997 or an on-line version at http://www.grove-ent.com for a review which includes quantitative test results.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels See US patent 4,270,217, granted May 26, 1981. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100

components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite. See US patent 4,409,688, granted 11/11/83 for further insight.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC895XLT TrunkTracker(Uniden): 1997 vintage. Base with 300 channels in 10 banks. Covers military air band, but other frequency coverage is limited compared with the BC9000XLT. Predetermined AM and NFM modes not selectable. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. Weather alert siren. Built-in CTCSS decoder and tone finder. A query feature identifies duplicate memory channels. Test unit scans 85 channels/sec and skips empty channels. Triple conversion, 380.8 or 254.4, 10.85, and 0.45 MHz IFs. 800 MHz images in commercial and military air bands attenuated over 35 dB. For technical test results and a review, see "The Uniden Bearcat BC895XLT," by Bob Parnass, AJ9S, in Monitoring Times, December 1997.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob. Selectable AM, NFM, WFM modes. Optional CTCSS decoder. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. For a full review, see "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995. For tips and modification information, see my column in June 1996 Monitoring Times. See US patents 4,947,456, granted 8/7/90, 5,163,161, granted 11/10/92 and 5,212,817, granted 5/18/93 for further insights into fast scanning and searching implementation.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan,

search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. NiCd pack provides about 5 hours between charges. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995 and "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

REGENCY

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band

scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. See US patent 4,057,760, granted 11/8/77. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels

are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Z60: base/mobile sporting 60 channels, but 10 of them are for FM broadcast only. Built in alarm clock, priority, and memory which requires no battery backup. Covers 30 - 50, 88 -108, 118-136, 144-174, 440-512 MHz. Notice that it's not spec'd to cover some important federal bands: 136 - 144 and 406 - 440.

RCA

RP-6150: 1997 vintage. No frills, good performing portable. 200 channels in 10 banks. No military aircraft frequency coverage. Triple conversion and a flexible battery arrangement. Lacks duplicate channel detection, search skip, and empty channel lockout features of newer designs. Our sample isn't super sensitive at 470 - 512 MHz and has some intermod around the VHF railroad channels but is generally more resistant to image problems than the BC230XLT. For technical test results and a review, see "The RCA RP-6150 Portable," by Bob Parnass, AJ9S, in Monitoring Times, April 1998.

RELM

HS200: 1996 vintage. Very good 200 channel portable. 10 banks. Built-in CTCSS and DCS decoder. Lighted keypad. Duplicate channel detection. 100 frequencies can be locked out from search. Very good audio and strong front end. Excellent internal shielding. Global rescan delay. Covers CB. Fixed modes and step sizes. IFs are 280.2 and 0.45 MHz, and perhaps one in between. See "The RELM HS-200 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1997, for a review which includes quantitative test results.

MS200: 1998 vintage. Made in USA. 200 channel mobile with alpha labels. CTCSS and DCS decoding squelch. Programmable via PC using supplied software. Low contrast, LCD display. Keypad backlit for night programming. Rear panel tape audio jack. Test unit had lots of intermod on VHF-high band. IFs are 280 and 0.45 MHz. See "The RELM MS-200 Scanner," by Bob Parnass, AJ9S, in Monitoring Times, March 1998, for a review

which includes quantitative test results.

RADIO SHACK

PRO-24: 1983 vintage. Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

PRO-26: 1995 vintage. (Not to be confused with a simple 1985 crystal controlled portable bearing the same model number.) Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image rejection causes 929 MHz paging interference in 170 MHz range. IFs are 380.7/254.4, 58.075, and 5.5/0.455 MHz. Audio suffers from small speaker. See "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

PRO-30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were

used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range. IF frequencies are specified at 608.005 - 611.2 MHz, 48.5 MHz, and 455 kHz.

PRO-52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO-60: 1995 vintage. Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning. See "The Radio Shack PRO-60 Portable," by Bob Parnass, AJ9S, in Monitoring Times, September 1995.

PRO-62: 1994 vintage. Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO-64: 1997 vintage. Good portable 400 channel scanner using up conversion. Replaces PRO-62 and has many more features. Selectable AM/NFM modes but fixed step sizes. 10 search banks which can be cascaded. Auto store saves unique frequencies found during a search. Frequencies can be loaded using a computer but optional interface kit not yet available. Can recharge Radio Shack's optional, monolithic NiCd pack, but not AA cells within the scanner. IFs are 257.5, 21.4, and 0.455 MHz. See "The Radio Shack PRO-64," by Bob Parnass, AJ9S, in Monitoring Times, August 1997, for a review which includes quantitative test results.

PRO-67: 1997 vintage. Good portable 200 channel scanner using up conversion. Replaces PRO-51 and has better image rejection and super fast scanning. Service Search lacks police frequencies. Fixed AM/NFM modes and step sizes. Can lock out up to 20 frequencies during a search. Can recharge AA cells within the scanner. Frequencies adjacent to the cellular phone bands censored so our PRO-67 will not receive 868.9625 or 823.9625 MHz. Intermediate Frequencies are 254.4, 10.85, and 0.45 MHz. See "The Radio Shack PRO-67,"

by Bob Parnass, AJ9S, in Monitoring Times, October 1997, for a review which includes quantitative test results.

PRO-91: 1998 vintage. Portable made by Uniden for Radio Shack. 150 channels in 5 banks. Can selectively follow conversations in 800 MHz Motorola trunked radio systems. Censors 823.975 - 823.95 and 894.0125 - 896.1 MHz covered by the BC235XLT. Powered by four individual AA alkaline or NiCd batteries. Power save feature. Program key. One priority channel/bank. One search bank. Direct search. Service search omits many police freqs (inc. 460 - 460.5 MHz). While connected to an outdoor antenna, our PRO-91 experiences intermodulation interference in the 161 MHz range from a paging transmitter on 158.1 MHz. IFs near 380.7, 10.85 and 0.450 MHz. See PRO-91 review by Bob Parnass, in Monitoring Times, December 1998, for review with quantitative test results.

PRO-2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO-2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO-2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan.

Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO-2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO-2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO-2022: Base/mobile scanner. Like the PRO-2021 but includes the 800 MHz band. Somewhat prone to intermod in the 460 MHz range. Cellular images throughout the 847.6 - 869 MHz range. See September 1996 Monitoring Times for modifications.

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. Broader IF selectivity than PRO-2006. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO-2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IFs -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The

Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: 1994 vintage. Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses, e.g., reception of cellular telephone calls in the 460 MHz UHF-high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart Auto Store feature stores the unique frequencies. Can lock out up to 200 frequencies from search. Query facility indicates if and in what channel a frequency is programmed. Scan skips over empty channels automatically. Can sort memories by frequency within a given bank. IFs are 609 - 612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than PRO-2006. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042," by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

PRO-2045: 1996 vintage. Very good 200 channel base/mobile made for Radio Shack by Uniden. Tuning/channel selector knob. 10 banks, selectable attenuator, and rescan delay. CTCSS-capable with optional board. Great Auto Store. Weather alert. Scans and searches fast. Can lock out 50 frequencies during search. Step sizes fixed but AM and NFM modes are selectable. IFs are 380.7, 10.7, and 0.455 MHz. Images on VHF-high band despite high 1st IF. Some intermod on review unit. See "The Radio Shack PRO-2045," by Bob Parnass, AJ9S, in Monitoring Times, February 1997, for a review which includes quantitative test results.

PRO-2046: 1996 vintage 100 channel mobile made by Uniden with fairly good performance. Descendent of the BC760XLT but no CTCSS option available. Ten banks of ten channels.

Scans memory at about 34 channels/sec. Service search, direct search, and band search. Preset search limits by band and user cannot program the search limits. Image rejection is minimal, as one would expect from a scanner with IFs of 10.85 and 0.450 MHz. 10 Monitor memory channels. Can lock out up to 20 channels from a search. See "The Radio Shack PRO-2046," by Bob Parnass, AJ9S, in Monitoring Times, October 1996, for a review which includes quantitative test results.

PRO-2050: 1998 vintage 300 channel Motorola trunk system tracking base made by Uniden. Tight front end. Excellent performance. Chassis-less, plastic construction. Squelch and volume knobs too close and Manual key is hard to find. IFs are 380.7 (approx.), 10.85, and 0.45 MHz. AM and NFM modes are factory set and not selectable. 300 channels in 10 banks and a 2 second rescan delay may be programmed on a per channel basis. Query feature identifies duplicate memory channels. Our PRO-2050 scans at 78 channels/sec., skipping over empty channels. 10 priority channels. Up to 50 frequencies may be locked out from limit search. A single pair of limits may be programmed for a limit search. No Direct key or direct search facility. Factory preprogrammed frequencies for police, fire/emergency, commercial air, public service, and weather, but not marine. See May 1998 Monitoring Times for a review which includes quantitative test results.

SONY

SC1PC: 1998 vintage. Good RF and audio performance. Covers 25 - 1300 MHz, minus cellular phone. Selectable step size and mode. Computer control and downloading with software and PC cable provided. Powered by ordinary AA batteries. Provided CDROM includes both the scanner control program and the multi million record PerCon FCC license database. 10 banks ("pages" in SONY parlance) of 30 channels each. Per-channel 2 second rescan delay. Unlike the ICOM IC-R10, you can scan any combination of memory banks. You can lock out ("skip") memory channels from scanning. The frequency stored in a skipped channel will also be skipped during searches. One priority channel checked every 5 seconds. SONY's limit search is restricted to one pair of search limits, though computer control expands this to 20 linkable pairs. Band search lets you search through 17 bands programmed at the factory. Service search. A cache, termed Intelligent Memory, stores the last 10 unique frequencies that were active for longer than 5 seconds each. IFs (in MHz) are 600 (below 370 MHz), 232.5 (above 370 MHz), 45.0, and 0.455. See "The SONY SC1PC," by Bob Parnass, AJ9S, in Monitoring Times, August 1998, for a review which includes

quantitative test results.

SPORTYS

JD-100: 1997 vintage. Limited 20 channel scanner which covers civil and military air bands only. Good audio. Large display shows frequency only out to 2 digits. Slow scanning and odd keystroke sequences. No key press confirmation beep. Cannot lock out channels from memory scan. Powered by AA batteries. Battery saver circuit. See "Sportys JD-100 Air Scan," by Bob Parnass, AJ9S, in Monitoring Times, November 1997.

CRAIG (division of PIONEER)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

SONAR

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no

scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X		no	
FR105	6	X		no	
FR2512	24	X		no	
FR2513	24	X		no	
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2516	10	X		yes	yes
FR2517	10	X		yes	yes
FR2525	10	X		yes	yes
FR2526	10	X	X	yes	yes
FR2527	10	X	X	yes	yes
FR2528	10	X	X	yes	yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

TENNELEC

Manufactured the first synthesized scanners. See US patents 3,961,261 and 3,962,644, granted 6/1/76 and 6/8/76 respectively. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel

programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. Better image rejection than most scanners (see article by Bob Parnass in Monitoring Times, January 1996 for comparison). The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency. Too, the P1 and R700 require different crystals.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. For more information, see "Add a Crystal Receiver to Your Arsenal," by Bob Parnass, January 1996 Monitoring Times.

Custom Color Map & Report
of Transmitter Sites Near You

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state,

and produce a custom RadioMap(TM) report, including a beautiful 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central

time. For a brochure, send SASE.

How to Obtain Copies of Patents

Printed copies of US patents may be purchased for $3 each, but you must know the patent number. Credit card orders are taken over the telephone by the Assistant Commissioner for Patents at (703)305-4350. Alternatively, you can mail a check or money order, made payable to "The Assistant Commissioner for Patents" to

The Assistant Commissioner for Patents
Washington, DC 20231

For more information about the US Patent and Trademark Office, call their automated information message system toll-free at (800)786-9199.

There are various patent servers on the world wide web, including IBM's server:

1340. RPL111 - OB Chat Starts @ 9:00 pm EST

Newsgroup: rec.radio.scanner
Date: 1999-02-13 00:00:00 UTC
From: dpinero@pobox.com
Message-ID: <36c5ac11.8914373@news.mindspring.com>
Source record: 127710
Cross-posted to:
alt.law-enforcement,alt.radio.scanner,rec.radio.scanner,alt.radio.broadcasting.open,alt.emergency.services.dispatcher

The scheduled chat regarding closed broadcasting policies in Harris County, Tx., begins tonight at 9:00 p.m. EST. General release follows:

CHAT WILL FEATURE DISCUSSION ON CLOSED BROADCASTING POLICY IN HARRIS COUNTY, TX.

Many public safety officials believe that encrypted or "closed" broadcasting enhances officer safety and common-sense security. Open broadcasting pundits, of which many are hobby scannerists, believe the exact opposite and have adopted most if not all of the principles exemplified at http://members.aol.com/truth4000/page1.htm .

Until recently it was a fair democratic debate between experienced, well-intended public safety administrators focusing on security issues; and close-to-the Earth scannerists who fully understood what benefits positively exploited open broadcasting policies could mean. They had after all been taking advantage of a technically-dictated 60-year reign of open air communications.

However, the tone turned ugly in at least one confrontation between an open broadcasting preservationist and his local officials, and it may be a sign of the things to come. A scheduled chat hosted as an open broadcasting advocacy event will focus on censorship-like efforts on a radio monitoring website in Houston, Texas.

John, the webmaster of HoustonScan.com, will answer questions and generally discuss his experiences with Harris County Officials who demanded that he remove a list of trunking IDs from his website. He will also talk about the outcome of his efforts which will inspire, enrage, and shock everyone present.

The chat will be held Saturday, February 13th, at 9:00 p.m. (EST) in the java-based open broadcasting chat room found at:
http://members.aol.com/truth4000/chat2.htm

The chat will last officially one hour. Obviously, however, great discussions are never terminated and may run the gambit of the evening depending on interest and turn out.

To get some background on John's experience, visit his excellent information site at:
http://HoustonScan.com/ and http://RadioScanner.com/

This is a grass-roots philosophical movement. There is no budget, no grand standing, no attempt to judge. The chat, as are all open broadcasting chats, is driven by the wisdom and insight of those who understand the benefits of open broadcasting, and the threats of public safety systems going closed.

In the event of technical changes or updated chat information, you can check bulletins posted at http://members.aol.com/truth4000/page1.htm . For the truly interested, I encourage signing up with the Listbot-based listserv dedicated to this niche theme. A form for doing so is provided at the above site.

This notice will be retransmitted multiple times until February 13. For your filtering convenience, the key 'RPL111' has been added to the subject line so that the messages will be deleted in your future usenet sessions.

See you there!

1346. CB RAMBO Came Back Due to Popular Demand

Newsgroup: rec.radio.scanner
Date: 1999-02-13 00:00:00 UTC
From: cbrambo@aol.com
Message-ID: <19990213123007.08892.00000552@ngol01.aol.com>
Source record: 127716

Here's the deal...to those of you who are bellyaching about me being here, you actually have nobody to blame but yourselves.

I ceased all postings on this newsgroup as of 1/2/99. A check of DejaNews will easilly confirm this. Over the next month or so, I read this newsgroup on a daily basis, buit did not post a note. I continually came across threads such as "Where's CB Rambo?", "CB Rambo is Gone", "Is CB Rambo Coming Back?", "I Miss CB Rambo", etc. Obviously, I was sorely missed here. A couple of weeks ago, a "new" CB Rambo decided to appear via DejaNews. I found this to be a rather poor imitation of the original and decided I must return in order to restore my good name as the true and proper owner of the "CB Rambo" monkier and likeness.

So you see, I only returned due to popular demand. Obviously, you nice people missed me a great deal. I humbly accept your request that I return to this newsgroup on a daily basis and provide my unique brand of humor, entertainment, and expert ham radio analysis. Feel free to post your "thank yous" publiclly...but please, no cash donations at this time. Instead, I request that you make a small contribution to "The Casey Thrower Mental Treatment Foundation" in my name.

Thank you for your time...and God Bless America!

1347. "listening" to aircraft transponders

Newsgroup: rec.radio.scanner
Date: 1999-02-13 00:00:00 UTC
From: laird@tsunami.ecn.purdue.edu
Message-ID: <7a4dpjroh1@mozo.cc.purdue.edu>
Source record: 127717
Cross-posted to: rec.aviation.misc,alt.radio.scanner,rec.radio.scanner

I haven't had success looking for information about aircraft transponders. My interest is in listening to transponders (passively) to determine altitude, ID code, and, if possible, approximate location of aircraft.

I'm aware of certified (collision avoidance) units, but I'm wondering if there's an inexpensive way to do it.

Any pointers?

Thank you.

1352. Re: 4-level FSK decoding

Newsgroup: rec.radio.scanner
Date: 1999-02-13 00:00:00 UTC
From: R Clark <rcclark@nospam.tenet.edu>
Message-ID: <7a4gh9$54k$1@mercury.hiline.net>
Source record: 127722

4-Level FSK is not related to APCO project 25. APCO project 25 was established to reduce the bandwidth used by radios in the FM mode. At the start of project 25 FM spacing was 25 kHz and the project specified using digital protocols (TDMA/CDMA) to achieve 12.5 kHz spacing, followed by 6.75 kHz spacing as technology developed to allow this. There was a huge fight between GE and Motorola about which digital protocol to use and as a result it slowed down the whole process to a crawl.

4-Level FSK is used to transmit digital data in 4 separate levels. The digital transmission have proprietary names like FLEX or REFLEX which both belong to Motorola. FLEX and REFLEX are used to transmit data to pagers. 4-Level FSK decoding is used to demodulate the 4-Level digital signal to be used by your computer and software to decode the data part.

You can use a 4-Level FSK decoder hooked up to the discriminator output of your scanner to decode pager messages broadcast over the air.

>Can anybody clarify what 4LFSK decoding is? Would that be the APCO 25
>ANALOG TO DIGITAL PROTOCOL used in motorola's astro radioes. Or is it some
>other type of digital signal?

4-Level FSK decoder available CHEAP from Texas 2-Way (956)702-2481
Decodes Flex, Reflex, Pocsag, Motorola trunking data, Packet, and others!

Has anyone used the R2 programming S/W with success (featured on the Strong Signals web page http://www.strongsignals.net/). I can download but not upload, keep getting CL ERR messages and new data is not registered. Icom still doesn't have theirs ready yet and this looks like a nice package to use in place of the Icom version. Thanks for any hints.

Andy

From: Don <dtmknsn@ix.netcom.com>
Message-ID: <36C5D3EB.BB6579F7@ix.netcom.com>
Source record: 127728

Well, to start off, you can pick up hams 1.280 - 1.286 mHz. Then there are the TACANs 960 - 1.250 mHz. There is some other stuff too but alot of it is point to point so you just about need to be in the "path" of the signal to pick it up. Sooooo, if you have the capability use that "search" button & check it out!

1365. BC9000 CTCSS problem

Newsgroup: rec.radio.scanner
Date: 1999-02-13 00:00:00 UTC
From: QESK41A@prodigy.com
Message-ID: <7a4ocq$8om8$1@newssvr04-int.news.prodigy.com>
Source record: 127735

I've had a BC9000XLT since '95, and never had a problem with it until a couple of weeks ago. The CTCSS, although it appears to be working, passes no audio on the channels that have CTCSS programmed.

Is this a unique problem, or has there been a noted defect in the CTCSS boards? Any help appreciated.

Ed

Noooo, the show on PBS claimed that EVERY lightning in the world
could be heard at the same time at a certain frequency.
You can only hear local (within 100-200 miles) lightning when tuning to
JUST any blank channel, not all the lightning in the world.
Also, I wish PBS would stop showing that damned show.
It's about 3-5 years old now but they keep pushing it off as new.

You'd have to trust the accuracy of the preprogrammed frequencies
and that's not a good bet.

Scanner folk are much better off with a general purpose scanner with
a full numeric keypad, 100 - 200 memory channels,
and fully programmable search limits.

Too, the BCT7 I tested was quite prone to images.

Greetings!

On Fri, 12 Feb 1999 09:29:39 -0800, While the Monitor displayed an
idea about "Re: John Mackey admits wrongdoing!" from
'txjones@tyransportz.com (Tom Jones)'. The Keyboard responded with
this:

:+> While I agree with you 100% about the Mackey flame problem and the horror
:+> of seeing it migrating out to the other newsgroups, I would take
:+> exception to you claiming rec.radio.cb as YOUR newsgroup. What about the
:+> other people who use that newsgroup? Do THEY know that you own it?

You mean it was for sale?

Not that I'd own it...;-)

But it would be nice if "Damage Control" would kick in and reduce the
number of NG's this thread posts to. Especially when other NG's have
no idea, or a desire to know, what this thread is all about...

I'm simply posting this back to remind others.

EOT...

Regards!

He had a 5 page rap sheet but I don't believe he was a Third Strike
candidate. He was wanted for parole violation and would have went
back to prison. Now, if convicted, he could face the death penalty
for killing a peace officer. He'll most likely spend the rest of his
life watching color TV and getting 3 meals a day at the California
tax payers' expense.

First determine if your local public safety agencies are on a trunking system. If they are and you don't have a trunk scanner, you won't be able to follow the conversations. I just bought a PRO91 from RS and works great. The Uniden is also a good scanner for what you want.
I have an 800 MHz scanner PRO39 I bought years ago. I live in San Bernardino County California and all safety agencies are on a trunk system. Good Luck.

I use a 900 mhz phone at work, one of the Motorola clearnet, digital cellular phones, it puts out a few watts, and I do occasionally get a bit of a headache. It usually passes as soon as I turn it off, and no it isn't the person on the other end that gives me the head ache <G>. This is most noticable when I have been awake for 18-24 hrs and am talking a fair bit. The samew thing happens when I use a 5 watt handi talki, but not when I use a 35 watt mobile radio (the antenna is away from my head and I am shielded but the body of the car)

So, in other words, no, you are not going nuts or imagining things! <G>

==========

You people are sick!
All cops are pedophiles like me. This is why Pedophiles in Bristol
Township
are never watched or bothered cause we have the high council eats. Are
you
people retards? Don't you know that all of the district "7" judges
magistrates
are all heterosexual and closet case homosexuals pedophiles. Hey. I am out

of
the pedophile closet and I am proud to be a pedophile in Bristol Township.

Thanks Robert

Now for this Should-Be-dead cop in response.
He probably was a heterosexual cop, and heterosexual cops are all like
larva
and jest step on the bastard. So, fatally wounded this lil heterosexual
bastard is?
Well. thank God!

Will Maxwell

Rabbit,
The converter adds "400mhz" to the frequency the scanner
is tuned to..... i.e. a scanner tuned to 423.300mhz will now
be receiving 823.300 mhz with the converter in the "on" position.
In "bypass" position, the scanner reads the original freq.

1400. BC3000XLT Question

Newsgroup: rec.radio.scanner
Date: 1999-02-13 00:00:00 UTC
From: Richard Greaney <greaneyr@inspire.net.nz>
Message-ID: <36C53DC0.FCDE53BF@inspire.net.nz>
Source record: 127776

Discovered a few months back that if you hold down certain buttons on a Uniden BC 3000XLT, you can alter certain functions. It got me wondering..

1) Why don't they mention this in the manual? If they bothered putting it as part of the device, you would think the least they would do is tell us how to use it properly :)

2) Are there any multi-key combinations? SO far, i have tried pressing every key and turning it on, and get a few settings changed (light, sort mode, scan dir, delay time and a few others) Have I got them all?

Would appreciate it if someone could let me know if they have found any others

Cheers

No...but gave them a citation....believe it or not, it's for everyones own good. I personally believe that just like I do not believe in some ordinances or laws. So I enforce those ones as much as I can with DISCRETION and give them warnings whenever I can.

I don't know anything about the Commtel but I've got 2 Yupis, 7100 and 7200 and they're both alike in one respect. They're outstandingly sensitive, but if you're in a big city environment, RF all over the place at high levels, you'll hate either one. Especially if you do much listening in the 800+ range. They must be shielded internally with Saran Wrap (just like some Uniden scanners I can think of) because there's intermod/images ALL over the place, bad enough to make either one just about useless.

If you're out in the country or in a suburban area without TV/radio/beeper stuff all around you, that's when the Yupis really are wonderful. Make sure you use a good antenna though, if the 7100 still comes with the telescoping metal whip, you should be all set. The 7200 comes with a rubber ducky that's sort of junky, time to go shopping for something better.

good luck ArtM

>
>Zman
>
NOPE he was not. he was going a job on me.

YOu see, we have this PENAL code that states that
Press are allowed in. period. Crime scene is not
part of the penal code. It's a gray line. A gray
hole in the law that cops use to keep the PRess out.

it's an "effect of law" which is not written up and
legislated. Just a way for some company to make the
tape that says "crime scene, stay out" ...many bucks
made with this sign on this tape the cops roll out on
every scene they can. the makers of love it.

I used to save the large lengths of tape and keep it
in my Car and when at a crime scene give it to a SGT
I know...of course, I got to stay within. He became
a LT and that ended that practice.

Crime Scene is ambiguous most of the time. Crime Scene
is an AfterThought when the ambulances have left and the
blood is still on ground and bullet casings are in evidence
and they must close it off to investigate. But while the
event is going on...no crime scene exists. they are too
busy ducking bullets and keeping little kids out and making
sure their asses are not in view to get shot off.

Crime Scene designation is bullshit. Most of the time. some times it's needed. And Most responsible Press People know that the reason is simply to "preserve the scene" as much as they can. The cops allow me to go to the other side of street where the scene is not part of.

But some cops make the hole block a crime scene and forbid the press access. That has begun to stop since the COP KICK uproar hit the tv screen with the cop videoed telling me to get out...that it was a crime scene and various govt. officials not in agreement with the cops at keeping the press out. Making up reasons to keep me out.

Again, I got the video and i got the cop telling me to get out...hell, I was sorrounded by cops with guns drawn and ready to "do it again"...but the crook was down on ground..they had the guy almost under control.

I was there...if he had shot that gun off again, I'd have had it. That's what I live for. The excitment of a crook getting up and opening his mouth and pulling his weapon out and "they waste him" with a volley of bullets and shotgun shells.

That is video. So far I have not been that lucky.

But one day....

bill conduit
etc.

The word is "lightning"

it helps when you look it up in
da dictionary first.

a better word would be "enlightening"

you have to learn the language. the
language is thee....

bill conduit
etc.

I have a 1975 Panasonic RF-1004 radio with the analog PSB band from
136-174 mhz and the AM-FM bands. Good speaker and well constructed.
Works well, except don't have power supply. Runs on four AA batteries.
Also, antenna screw needs to be replaced, but antenna in good condition.
Good radio for collectors or to manually scan the VHF band. $25
(shipping included).
Also have a 1950's GE tube radio. A 5-transistor table model. Nick on
the
top. It works. AM Band. $25 (shipping included).
Will sell both radios together for $40 (includes shipping).
E-mail me at dlessard@telplus.net.

From: Michael Salmons <msalmons@coins0.coin.missouri.edu>
Message-ID: <7a7eaq$a4i$1@lesche.lesche.missouri.org>
Source record: 127521

Hello,

I was scanning one night about 7:00 on a weeknight and heard a series of short announcements. The only connecting thread seemed to be they all involved MO state government. A typical announcemente was "Governor Carnahan has declared February Missouri Pork producers Month." (I'm making this up, I don't really remember what was said.) It sounded a news broadcast, except as I said they were all about state events or dates.

Does this sound familiar to anyone? I didn't log it at the time so I can't even tell you what freq. I'd like to know what it is and if it's a regular service. Any advice is appreciated.

Thanks

Michael Salmons
Columbia MO

Matt,

Nope, the attenuator's useless in this particular situation, the receiver's just totally swamped. It's the OTHER signals you want to attenuate, not the ones you're trying to scan. That's why my snide remark about Saran Wrap shielding. The only help seems to be to get out of town -- unless the hills you head for happen to have a nest of these horrible overpowered pager stations on them. Otherwise, the Yupis are wonderful. ... Art

1451. HR514 & digital scanners

Newsgroup: rec.radio.scanner
Date: 1999-02-14 00:00:00 UTC
From: jtward01@aol.com.nospam
Message-ID: <19990214185007.24036.00000687@ng-cb1.aol.com>
Source record: 127527

All,

While I've been one of those sounding the alarm regarding H.R. 514 and its possible prohibition of digitally capable scanners I think I may have figured out why Uniden and others are seemingly not concerned.
The proposed law will prohibit scanners that receive cellular and PCS frequencies (of course, cellular are already blocked) or that will convert "protected specialized mobile radio service" transmissions from digital to analog voice audio. Now, I've been concerned that the existing wording is too broad and could be used to prohibit scanners capable of decoding digital public safety communications.
Think about it. If PCS frequencies are blocked in new scanners then a scanner capable of decoding digital modes still wouldn't be able to decode digital cellular and PCS because it wouldn't be able to receive those frequencies in the first place. Even if it could receive the PCS frequencies it could still be designed so as not to function in digital mode when those frequencies are entered. This is much the same as the current 235XLT and other TrunkTrackers. You can only enter valid 800MHz trunking frequencies into the 235XLT when in the trunking mode. Surely the firmware in some future scanner could be written so as to allow only public safety frequencies (and other non-protected frequencies) to be converted from digital to audio.

I have for sale a UNIDEN MR8100 Professional mobile scanner. This is a high speed computor programmable scanner designed for use in serious mobile installations such as law enforcemnt etc. This unit is basically as NEW! It has had only several dozen hours of use in a base station environment. It is complete as new with all supplied accessories and cables. I will accept $300usd for the unit and that will include postal shipping in the US or Canada. Please e-mail ghynes@ilos.net directly if you are interested

You need to focus on 1030 and 1090 MHz. The waveform is very wideband (the term video is used) and it contains the interrogations and replies from aircraft relating to their IFF/SIF Mode 1, 2, 3, 4, C (Altitude) and the new Mode S digital data stream. Good luck in breaking any of this data out. Don't even bother with Mode 4, that's the military secure ID feature. Mode 3 and C are your best bets.

A recent post listed the new configuration for the SJPD (effective March 1999). Here is additional info from the San Jose Mercury News (the full article is at http://www.mercurycenter.com/premium/local/docs/redistrict14.htm):

S.J. police plan to revamp beats
Redistricting designed to better service
BY RAOUL V. MOWATT
Mercury News Staff Writer

The department is on the verge of reallocating its patrol officers based on calls for service within the last few years. The idea is to give more efficient and complete service to residents.

Ideally, redistricting should occur about once every five years, police say. But the department last redid its patrol boundaries in 1986.

The department set up a committee in 1995 to begin the process. The committee's plan are to be implemented on March 21. ``It is probably the major project the department has been working on for the last few years,'' Capt. Tom Brewer said.

The department currently spreads patrol officers over 12 districts and 61 beats. The new model will have 16 districts and 83 beats. Generally, officers will be responsible for a smaller area.

Yep. I've also pulled bodies out of cars that weren't wearing them (drivers, not cars)and have picked up the pieces of drivers/passengers that became human missiles after being shot through windshields in collisions that would have survived had they been wearing their belts, but lets not turn this into another belt vs no belt forum; it's been done to death. No pun intended.

Greetings, all...

When HR 2369 was dropped on us in 1997, I wrote up a letter that went through several edits as it got sent to my Representative (and was ignored), Senators (and *wasn't* ignored!), and the members of the appropriate Senate Commerce subcommittee. I also posted a copy here in r.r.s and a.r.s and received a number of complementary messages about it.

I've written up another set of letters. They can be found at

http://www.dimensional.com/~efricha/HR514

If you think they're good, *please* use them as examples or templates for your own. Trim them down to whatever length you are comfortable with -- these are too long. If you don't think they're any good, please write a better letter! This legislation is moving very, very fast -- I'll be surprised if the full Senate doesn't vote on it before the end of February. We should do every thing we can to make sure that doesn't happen.

I think that The Powers That Be want to slip this one through congress before any resistance can be organized. Please don't waste any time -- start writing letters!

Eric

If your interferance is coming from a pager frequency(or any offending freq for that matter) you can do what i did, i first found the frequency that was causing the problem, then figured what a quarter wave length was at that frequency, then i went to the radio store and got a T connector and plugged it in the back of the scanner, on one end of the T i plugged the antenna in, now i took a piece of coax cut at a quarter wavelength of the offending frequency and plugged it into the other side of the T, with the proper PL-259 on one end of course, on the other end i tied the shield and the center conductor together, that provided a very good notch filter for that particular interference. Or you could buy a commercial notch filter.

I'll say it too!!! There is NO ONE who has contributed more towards
scanning than Rich Wells (with possible esception of Bob Parnass
as they are a a close call!)

I have been watching this news group
since the BC895 came out, Awaiting
modification's of different sort. But
so far none have arrived that I am
aware of. I know the radio probably has
great possibilities, but no one has seen
fit to take up the endevor. I only have the ability to follow instructions
layed out by
another, so I sit and wait.
I have been wanting a way to manually
switch from AM to FM mode. As it is now
you are stuck with watever is preprogramed.

Mark

1498. winradio problem?

Newsgroup: rec.radio.scanner
Date: 1999-02-14 00:00:00 UTC
From: Daniel Dancy <dddancy@mediaone.net>
Message-ID: <7a70lk$qb4$1@denws02.mw.mediaone.net>
Source record: 127613

Does any body else who owns a winradio have a problem with memory scanning? As it scans my local police, fire frequencies it emits a quick static sound between them ,some of them not all. I emailed winradio and they said it was because of windows timer interval and system resource but my system resource is 90%. wondering if any one else had that problem?
And they said nothing could be done. Does any body out there of any opinions? I do like winradio but that noise is driving me nuts.

What you witness loser is what you read in newspapers and tabloids, or a friend sayin, "this cop stopped me the other day...for no reason of course." You are such a loser with no friends, no life, no way to communicate so you take it out on people that you do not even know. I got some toll free numbers to give you if you would like to talk to someone...they are experts in mentally challenged.

Thank you for explaining things to the ones not fortuanate enough to have recieved the other 2/3 of their brains upon birth. That was a very good post but with one thing though. I know you are very into your job and all and that is commendable. But the cop you thought was being a cowboy...might have been doing his job. Yes, you had the right to be there but especially in a scene like that which would require quite a distance to cover it, you just might have been in the crime scene. Take Care and happy "shooting"!!

1521. Multiple ACARS Freq's

Newsgroup: rec.radio.scanner
Date: 1999-02-14 00:00:00 UTC
From: geoff_kay@my-dejanews.com
Message-ID: <7a559e$88u$1@nnrp1.dejanews.com>
Source record: 127668

Do aircraft transmit ACARS information on more than one freq simultaneously.
I suffer a lot of localised interference on 131.725 and wondered about trying
the other freq's. 131.525 always seems totally quiet though. Any thoughts?

This is the normal operation of the extender. It allows the officer to use the handheld just like the car low band. Ch 1 makes the car radio transmit on the car to station freq, Ch 2 makes the car radio transmit on the car to car (or main station to car) freq, Ch 3 is extender radio to extender radio simplex (154.905 with no PL tone). Extenders are and have been for many years in use as CHP standard equipment. They first came out in 1979.

Does anyone know if and when Uniden will come out with a mobile scanner size/feature similar to the BC760XLT that will have the abilities of the new BC245? The market is sure there, and Uniden is surely missing the boat if in fact they are not planning to release a mobile version. Yes, I am aware of the not-so-small Radio Shack mobile version.

>Thank you,
>Bill
>
As I recall, the MR8100 was disigned for the California Highway Patrol and their Low-Band GE Delta S and/or SX mobile radios. The "green wire" was to be hooked to a spot in the Low-Band radio that went to ground when the mic was keyed, and was not grounded when the mic was not keyed. By doing all this, the receiver in the MR8100 would not get over loaded and "killed" by the high powered Low-Band transmitter. And when both antennas were installed on a Ford Mustang, there just wasn't enough physical seperation available for the antennas on such a small car for the MR8100's receiver to not get killed.

Hello. I have a Radio Shack Handheld Frequency Counter for sale at $55 shipped. It's exactly like the new HT Frequency counter that RS has now. It's in excellent working and excellent cosmetic condition and has very little use on it. Let me know if your interested. Here's all of the information on it:

-Covers Every Frequency From 1-1300 MHz
-Reads Up To 4 Spaces To The Right Of The Decimal
-Will Pick Up Transmissions On AM/FM/CW
-Selectable Bellow Or Above 50 MHz
-Slow/Fast Gate Speed Selectable
-Has Back Light Switch Also
-Includes Batteries, Telescopic Antenna, Original Box, Original Packaging, and Original Manual

Will trade for a 20 amp or higher DC power supply, any Kenwood HF accessories, or an All Mode (AM/FM/SSB/CW/RTTY) base frequency counter. Or if you have anything else let me know. Thanks for reading.

Hello. I have a Radio Shack 7 Channel Digital WX Alert for sale. New cost is $40 plus tax. My price is $25 shipped. It's in excellent working and very good cosmetic condition and has very little use on it. Let me know if interested. Here's all of the information on it:

-7 NOAA Weather Channels Programmed In
-Volume Control With External Antenna Jack
-Sounds Full Volume NOAA Alert
-Also Has Test Button And Built In Speaker
-Includes AC Power Cord, Telescopic Antenna, Manual, NOAA WX Pamphlet, Original Box

Will trade for a 20 amp or higher DC power supply, any Kenwood HF accessories, or an All Mode (AM/FM/SSB/CW/RTTY) base frequency counter. Or if you have anything else let me know. Thanks for reading.

Jim,

According to my records...

WALK (AM) 1370 KHz Helicopter uses 161.73 MHz
WALK - FM 97.5 MHz Helicopter uses 450.5625 MHz

My notes show activity on the UHF channel. The VHF channel may be from FCC records or an old frequency. It's worth monitoring both channels for a while for activity.

Happy Listening!

Mark/W2MR

Finallly I got the Answer...

(Read below my Signature for my original Post)

Now The Question is WHY....

Im hearing an Image of a local taxi Company
on 823.3750, there Transmitter is on 851.0875

That makes a 27.7125 Mhz difference...

How does that Compute to be an IF Freq ?

Keith

Source record: 127390
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I've recently started experiencing some strange behavior with my BC3000XLT that I'm hoping that someone can help me explain.

For the last couple of weeks I've been receiving garbled transmissions on several frequencies that I listen to in the 462-464 MHz region. What is weird is that if I switch to AM, the frequencies are fairly readable. Transmissions are not always garbled, but it is probable that the clear transmitters are not the same ones as the garbled ones. I have not been able to identify who the garbled ones are.

Does my unit need to go in for repair? Am I really hearing an image of another frequency? Is AM a legal modulation type for these frequencies? Could I be experiencing signal skip from say Mexico (is NFM the standard for these frequencies there?)

My location is just south of Los Angeles (Fairly RF dense). It happens both when I'm using a Watson Super Gainer antenna (duck) and when I use a Radio Shack Mag Mount.

Any help is appreciated.

Thanks.

-Dave-

I am looking for a realistic scanner that is an 8 channel crystal controlled scanner made in the seventies by or for radio shack. I cannot completely remember the nomenclature on the radio, however, it is something like a pro-7a or pro-7b or something to that nature.

The radio is a mobile 8 channel radio. Black case and faceplate with a row of 8 white pushbuttons and 8 amber lights to indicate the channel being scanned or listened to. The radio came in single band configurations as far as I know.

I am wanting the VHF-hi version of the radio.

I would prefer a radio that is working. I do not care if the crystals are included or not.

Any offer please forward to my persoanl email account at:

N6RHL@mho.net

Thanks, Dave..

Starman,

One comment. A scanner is only a receiver. If you wish to communicate with a base you will need a transceiver. For this I believe there is a service in the USA called FRS (family radio service). Unfortunately, FRS radios to my knowledge to not have provisions for receiving the things you noted. A scanner, or scanning receiver, will have provisions for receiving what you have noted. Another, an possibly most useful, thing to listen to when hiking is the Weather channel. Probably the most useful tools for hiking would be a GPS unit and the FRS.

Cheers!

Well, with all due respect...there may be faults here there may not be. The problem, is that I was not there so I cannot judge. I do not believe all of what the media prints and I will leave it up to the courts to determine fault/guilt if charges are brought upon these officers.

I believe that the main problem with the 235's modifiability lies with the gobs of epoxy that cover the discrimnator chip and other important circuitry.

I don't care if some twerp have typos, but when a gun carrying public servant such as yourself has typos, it makes my skin crawl. You don't seem to get it do you?. You are not average Joe anymore dimwit. You are supposed to be a role model for the kids not to join gang, be a leader in the community, but how can you do all that when you don't even have basic command of the language?. That makes you look to me like you are the total f'ng looser.

Put the donut down Man and read some books. Say when do you go on patrols or are you on disciplinary leave or something?. You've been online almost constantly throughout the weekend. No crimes in New York no more?.

Teletubbies use 1339.00Mhz for their uplink to their mothership .
Teletubbies use 1336.00Mhz for the downlink from the mothership.
Teletubbies use 1333.00Mhz for simplex (Teletubby-to-Teletubby).
Teletubbies use 1330.00Mhz as a remote control frequency for their custard machine.
Teletubbies use 1297.00 for RFDing to locate their anal-retentive vaccuum cleaner, Nu Nu.

There's lots of cool stuff above 1000Mhz.

1562. In search of equipment sellers/dealers...

Newsgroup: rec.radio.scanner

ATTENTION PUBLIC SAFETY SELLERS AND DEALERS!

We are in search for private sellers and public safety equipment dealers to experience our new site. If you mention this advertisement, we will give you a $5.00 auction credit to use on the new site. We have been open for close to a month now and are receiving about 300 hits a day from bidders who are ready to buy your equipment!

It doesn't cost a dime to post items for auction... and we are the only auction site ever to support AUTOMATIC ITEM RELISTING!! This is a unique feature written especially for Public Safety Auctions at http://www.cpdc.com/. This feature allows you to post a new item for auction and then not worry about it until it finally recieves bids or meets your reserve price, otherwise the system will automatically relist your item when it closes without a winning bid. No more filling out forms over and over, or keeping tabs on when items close just so you can manually repost the same information! We want to help you in every way possible to sell your item!!

We are an online auction site dedicated to providing the best resource for public safety professionals. Whether you are collector, or you depend on this equipment as part of your career, this site is the place to be. We need your help to make this goal a reality, and we hope you see the importance of creating a safe trading site for folks like us who chose a career around public safety.

GO TO http://www.cpdc.com/

Thank you for your time, please share this site announcement with friends!

1563. Virtual Downconversion - PRO-26

Newsgroup: rec.radio.scanner
Date: 1999-02-15 00:00:00 UTC
From: colton@patlanta.com
Message-ID: <7a9fvd$5ss@news3.newsguy.com>
Source record: 127451

I've read about the virtual downconversion one con do to the PRO-26 so that the illegal-to listen-to cell band can be heard at 360-390. My question is technical in nature - I'm curious more than anything else.

The VD is to jump 2 contacts. You can put a switch in the jump if you like.

If you don't put a swtich in the jump, or if you leave the switch in the VD mode, how does this otherwise affect the scanner? Meaning, the jumper does something to allow images at 2IF below the cell band.

Does the jumper eliminate the 3rd conversion? If so, how does the scanner perform throughout the rest of the RF bands?

If not, what exactly does the jumper do and affect? I doubt that the jumper only affects the 360-390 range.

1564. Speaker Upgrade - PRO-26

Newsgroup: rec.radio.scanner
Date: 1999-02-15 00:00:00 UTC
From: colton@patlanta.com
Message-ID: <7a9g5s$5ss@news3.newsguy.com>
Source record: 127452

The speaker on the PRO-26 is average. I actually thinks it works fine. But I've heard that other handhelds have better audio (like the IC-R2). Considering the PRO-26 has just about everything one could want in a scanner, has anyone ever upgraded the speaker?

What I'm thinking about doing is trying to find the highest quality 36mm speaker I can (which will fit in the PRO-26), and replace the stock speaker. Has anyone done this? If so, will you send some sdvice or hints?

I have an unmodified 2A5 PRO-26 in excellent condition with:

PRO-26 Scanner
Stock rubber duckie antenna
RS telescoping whip antenna with center loaded coil
Case
Belt clip
4 NiCds
RS AC charger/power unit
Original box and manual
10' length of RG58 cable with BNC adaptors to make antenna remote

I assume it can be modified, but I've never opened it.

I'm thinking of getting a Yaesu VX-1R or VX-5R, or an iCom Q7A or R2 or T8A, but I can't justify financially having the PRO-26 as well.

What's the PRO-26 combo described above worth? I'd rather find out from someone on this NG (and selling it to someone on this NG if it seems worth it) rather than posting it on eBay. Am I nuts in thinking it's still worth around $300 (which is less than I paid in total)?

This brings up another question. Since PCS is digital, it uses its' own protocol to encode/decode transmissions. This means that on a conventional scanner, (most of which cannot receive the 1.9 GHz PCS band anyhow), all you hear is a static like noise.

Now let's tune it in on our digital scanner. You punch in the frequency, set it to digital, instructing the scanner to apply the APCO-25 digital protocol decoding to the incoming signal, and what do you hear? Nothing. Nada. Zip.

How come? Simple. The PCS digital protocol is ENTIRELY DIFFERENT than APCO-25. Since the scanner will never find a matching frame sync sequence, it won't know what's data and whats not (incidentally, this will happen on encrypted data transmissions as well) so the scanner will simply sit there and do nothing. If scanning, it will stop briefly, attempt to decode the incoming signal, fail to do so, and move on, all in less than a second (just like the existing trunk trackers do).

So, bearing that in mind, my question is why ban the frequency coverage? Existing scanners can't decode it, and the future digital one won't decode the PCS protocol either, since no public safety agencies will be using that protocol for their comm's. Seems like a useless redundant, assinine law to me. Our tax dollars would be better spent forcing the cellular industry to tighten up their own equipment to prevent IT from being hacked, since that is where 99% of cellular fraud occurs. If it were my goal to snoop on PCS phone calls, the first thing I'd do is buy a PCS phone, since it already takes care of decoding the protocol.

Let's tell our congressman/woman where they can shove this bill....

I've noticed that the built in CTCSS in my 895xlt is a bit quirky. If you spin the dial to the desired channel with CTCSS on, it sometimes doesn't kick in right, and no audio comes out of the scanner. If you turn CTCSS off, and then on again, it works properly. Annoying...

I got one of the first off the line though, so maybe it's been fixed by now.

From: Mike <mikeruc@gte.net>
Message-ID: <7a9mrfcuf1@news-2.news.gte.net>
Source record: 127459

Recently, while using my AR-3000A I fat-fingered the STEP ADJ key instead of the FREQ PASS key while in 2nd function mode. This apprently disables the search lockout feature for that particular bank. No matter how often you try to lock out a channel in search, the unit will still keep receiving it.

It drove me crazy until I realized what happened. All you have to do is push 2nd function and the STEP ADJ key again and this eliminates the problem.

I bought a 3000A in 1994 and was unable to lockout freqs in search. I wound up sending that one back and getting a refund. I bet it had the same problem I described above. I bought my present 3000A in 1998. It's an excellent radio. I hope this info helps someone. If so, let me know. Thanks...

Mike

I have a DJ-X10E. I agree it lacks selectivity. I used an in-line antenna tuner with it on HF and that helped. The sound is much clearer/louder than on the ICOM R-10, but I hear the R-10 is better on overloading--has filters for various band segments that switch in automatically.

Has anyone noticed a problem on the FM band? Try scanning up the FM broadcast band and see what happens. Mine used to miss some very loud, local signals between 100 and 107 MHz.

As far as the computer programmability goes, Alinco has provided no facility to do this, however, there is some shareware out there. I asked the guys at Optoelectronics about making it compatible with the SCOUT, and they say it's on their plate to do, but not a high priority.

http://www.javiation.co.uk/com205.html

Commtel
205
Click on picture for larger image

The Commtel 205 will be recognised by many as the PRO-2006 from Radio Shack - it is the same radio after all.

Distributed in Europe by Altai and manufactured by GRE in Japan it has (as the PRO-2006) perhaps the most popular base/mobile scanning receiver

in recent Years

Frequency coverage is continuous from 25-520MHz and 760-1300MHz, any mode of AM, NFM or WFM can be selected on any frequency and a choice of increment/channel steps can also be selected. Other than the internal 240v AC Power Supply the COM205 is **exactly** the same as the PRO-2006 so 30kHz increment steps are available between 824-849MHz and 869-894MHz.

400 memory channels store frequency and mode whilst the 10 search banks allow user defined lower and upper frequency limits to be stored together with mode and increment step. An additional 10 "monitor" channels are available to store frequencies that may be found during search.

Two speeds of scan/search are available, the faster of the two allowing around 26 channels per second to be scanned.

Internally the receiver requires a PP3 (9 volt) battery to maintain the memory contents when the receiver is not connected to a power source. The
receiver is fitted with an internal AC transformer (240 volts AC) or can be run externally via 12 volts DC.

For those wishing to use the COM205 with a computer the Optoelectronics OS-456 can be fitted. Once installed there is a wide range of software compatible with the OS-456.

Availability & Price

The Commtel 205 is available from stock.

Within the UK and the EEC the Commtel 205 costs ï¿½235.00 Pounds, this includes delivery and VAT. For export outside the EU the price is ï¿½199.00 Pounds and as a guideline this works out to be about US$330 at the moment.

Main Features Specifications

Frequency Coverage: 25-520MHz and 760-1300MHz
Modes: AM, NFM and WFM
Increment steps: 5KHz, 12.5KHz and 50KHz
(30KHz steps available on US cellular)
Memory Channels 400 (10 banks of 40)
Monitor Channels: 10 (for storing frequencies found when
searching)
Search Banks: 10

Sensitivity (from the manual)
AM (20dB S/N with 60% modulation): 25-1000MHz 2uV, 1000-1300MHz
5uV
NFM (20dB at 3KHz deviation): 25-1000MHz 0.5uV, 1000-1300MHz 3uV
WFM (30dB S/N at 22.5KHz deviation): 25-1000MHz 3uV, 1000-1300MHz
10uV

Selectivity (from the manual)
AM/NFM: +/- 9KHz = -6dB, +/- 15KHz = -50dB
WFM: +/- 150KHz = -6dB, +/- 300KHz = -50dB

Scanning Speed: Slow = 13 channels per second, Fast (Hyperscan) =
26 channels per seconds

Audio Output: 1.3 watts

Size:76mm (h) x 220mm (w) x 205mm (d)
Weight: 2.2 Kg

Supplied Accessories

Telescopic Antenna

Please everyone....We must exchange address and phone numbers and "correct" e-mail addresses for me to consider sale.

Since the best offer I received was for $700.00, the best offer above that mark gets it.

Thank you all.

1583. N.I.B.-- AOR-3000A Professional Grade Receiver F/S

Newsgroup: rec.radio.scanner
Date: 1999-02-15 00:00:00 UTC
From: casper@superlink.net
Message-ID: <7aa295$h5t$4@earth.superlink.net>
Source record: 127471

Hello everyone!

I have a new AOR-3000A Wideband receiver for sale.
Coverage is 100kHz-2036MHz (less cellular).
Unit is in original box with all cords and manuals.
Telescoping antenna is also included.
Please note: manual has been opened but is in excellent + condition.
Also please note: This unit has been stored in bedroom closet 4 years.
I have tested unit only to ensure unit is working properly. Needless
to say, this receiver is working flawlessly.

This unit is being sold together with a new GRE converter 9001.
The GRE model is designed for base model receivers.
All accessories are new and included with original box.
Cable, adapters, and manual are all new in packaging.
Please note: This unit has also been stored in bedroom closet 4 years.
I have tested unit only to ensure unit is working properly.
It is working perfectly.

Both units utilize BNC connectors. Included.

Keep in mind the GRE converter may be used with any radio receiver/scanner
that has restricted frequency coverage.

Both these units will be sold together and cannot be sold seperate.

I will include shipping + insurance of both these units for $800.00 or
best offer. Please e-mail me with serious inquiries only. I will be more
then happy to relay any infomation needed to prove authenticity for this
ad.

If you're asking why I'm selling these units, it is because I already
have 2 AOR-3000A units that I use frequently for monitoring.

The AOR-3000A wideband receiver is an advanced class receiver.
Should you consider adding this combination package to to your listening
post, please e-mail me.

**** Monitoring cellular conversations is now illegal in the United States.
Should you purchase this package from me, I ask you adhere to the laws
that govern the areas in which you choose to monitor with these devices ****.

Thank you all for reading my posting.

1584. Re: Frequency for Lightening?

Newsgroup: rec.radio.scanner

From: tcrpe <tcrpe@yahoo.com>
Message-ID: <4L0y2.10034$lx.4545@news2.giganews.com>
Source record: 127472

Xenon wrote in message ...
>Noooo, the show on PBS claimed that EVERY lightning in the world
>could be heard at the same time at a certain frequency.

Regardless, ther were NO crashes heard during that broadcast. I stand by my previous statement that once you hear your first lightning crash, you will know what it is. I heard none on that broadcast, and neither did you.
100 -- 200 -- or 12,00 miles.

One would presume that the distance at which it heard is dependen upon the sensitivity of the receiver, but at any rate I have never felt that the range exceeded tens of miles. Perhaps my car radio is junk. No, wait, it is junk, but it's also a great lightning receiver.

A limited range would be mort useful, don't you think. I'd rather be able to discern between lightning strokes on Oregon which don't affect me, and those right next door that may fry my head.

>You can only hear local (within 100-200 miles) lightning when tuning to
>JUST any blank channel, not all the lightning in the world.

I don't know if it extends to 100-200 miles, but it certainly doesn't extend worldwide. And I don't think I ever said that.

>Also, I wish PBS would stop showing that damned show.
>It's about 3-5 years old now but they keep pushing it off as new.

At least it isn't more of the politically correct crap they show normally.

1585. Re: "listening" to aircraft transponders

Newsgroup: rec.radio.scanner
Date: 1999-02-15 00:00:00 UTC
From: tos-tng@startrekmail.com
Message-ID: <7aa77p$6jv$1@news.erinet.com>
Source record: 127473
Cross-posted to: rec.aviation.misc,alt.radio.scanner,rec.radio.scanner

Actually a transponder would be useless, you'd need an "Interrogator" and then you'd also need the antenna system (it's directional) since you wouldn't want evey single aircraft responding at the same time. To make the transponder work in reverse you'd have to change the Local Osc, receiver tuning cavities and transmitter which all use cavities (at 1030 and 1090mhz you use tuned cavities) and then you'll need to totally redo the logic boards to "generate" the interrrogation pulse pairs as well as a sidelobe suppression pulse. You send the pulse pairs to the directional antenna and the sidelobe pulse to an omni antenna. This way any aircraft in the directional beam will see the interrogation pulses stronger than the sidelobe pulse and will respond, aircraft outside the directional beam will see the pulses at the same level or the sidelobe pulse a stronger and not respond. You might want to invest in a small search radar system so that you can identify the aircraft on the scope as the one responding to your interrogations.....all in all it's gonna cost a few $$$....Oh did I mention that you'll probably need to register with the FCC least they come looking for you for interferring with an aircraft navigation system..better yet join the military and get into the avionics career fields and you'll learn how all this works and also get to fix it when it goes bad....enjoy......marvelous things those transponders..........

I have a Pro-7A VHF-hi crystal reciever. It was my Dad's from the seventies. I am setting it up for Marine band listening. Mines not fro sale. Its great and I hope you find one. I had to replace one of the TTL logic chips. If you get one and it only scans a few freqs then thats the problem. There is a web site that tells you how to do this.

-Jeff

Hoping someone out there with an AOR AR-1500 can help me. My scanner recently has gone totally deaf, on the weekend I thought I'd open it up to have a look hoping it was something simple. It seems that one particular wire has somehow worked it's way loose. As I don't have a circuit diagram for this scanner I'm hoping that someone can tell me where this wire should be ! The wire is from CN6 on the middle (IF) board it is the leftmost wire (white).

Thanks in advance.

I've seen installs where the mic-hanger box was wired so that when the mic was taken off-hook, the switch in the hang-up box opened, causing whatever was connected to the switch to loose power until the mic was replaced in the hang-up box. Usually the stereo and scanner are the items that loose power in the above example.

If you don't live in a big city and you don't live next door to paging and cell phone transmitters, you will be fine. I live on the edge of a city of 140,000 and I have very few intermod problems on my Yupi. The few problems I do have come from a very strong FM broadcast transmitter about a mile from my house, any they do not severly affect my radio's reception. For me, the sensitivity far outweighs the slight intermod problems.

That's an interesting code...but put yourselves i the authorities position...I know a couple good reporters. But there are some that are just ruthless when the police are trying to contain, and get a scene under control...some times, they don't need all those extra bodies running around.

You are absolutely right about me being laughed out of town. Why?. I ain't a Copper and have no training as a Copper. This can;t be the best that you have, can it?.

You can't tell me how to do my job because I own my own company. I will have your ass thrown out of my business double time. As for you, you are just an ordinary public servant and therefore you fall under the review of the public.

I only turn on my scanner when I think something is going on (sirens, helicoptors, etc.), but in the last couple of days I have not heard the San Diego Sheriff's department. I wonder if they have changed frequencies. Since I live in Poway, I just monitor Frequency 4 and car-to-car.

If anyone has any info on new frequencies, could you please e-mail me. I do not read these newsgroups, so I would miss your response.

Thank you very much,

"JD"

I'll agree with what Bob (and Lee) said.

And I'd like to throw the Sony ICF-SC1 into the fray as well.
If you can get up to $320, you can get the ICF-SC1PC which has
computer interface/control and CD frequency database!

Good luck with your decision!

Source record: 127581

Bill Crocker wrote:
> Anyone had a chance to play with the new ICOM PCR-100, little brother to
> the PCR-1000?

Yes. It seems to perform nearly identically. But unless its $310 price is your very upper limit price tag, I would suggest the PCR1000 as a better value due to its discriminator output, AFC, AGC, SSB/CW, and smaller resolution steps for $400! Once the PCR1000 goes back up to $530+, the PCR100 will be the better deal.

Strong Signals,

Yup. If you can find a decent unit under $300 you really can't go wrong with the purchase. The Pro-2006 is a great scanner at these prices.

An authoritative source and author on the Pro-2004/5/6, Bill Cheek at bcheek@cts.com let me in on a deal on a load of hardly used 2006's last year. I had been using a dual conversion Pro-39 handheld and a Pro-2032 base. The Pro-2006 outshines these two scanners (and for scanners, 39's and 2032's aren't that bad). Needless to say, I've been real happy to make his aquaintance. Regardless of where you get your Pro-2006, if you're interested in modifications and a multitude of options for computer control for this scanner,...Bill Cheek has what you're looking for in the form of plans, a kit, or even a fully installed and bench-tested computer interface (CE-232).

Happy hunting. Hope you bag one.

Don't laugh, but if you had an 8ft ceiling at least in your house, you could use a Channel Master Monitenna. Although it is a vertical dipole designed for outdoor mounting, I have gotten great results with one in the corner of the room as well, and it certainly works far superior to any other indoor type of antenna.

1645. Re: Minitor pager tones

Newsgroup: rec.radio.scanner
Date: 1999-02-16 00:00:00 UTC
From: W8EMS@webtv.net
Message-ID: <17787-36CA2888-70@newsd-123.bryant.webtv.net>
Source record: 127294

Minitors use a two tone paging system where the base transmits one tone followed by another. These tones are detected by the tone "reeds" in the pager and let the audio pass to the speaker so you can hear the transmission. Depending on the model, most pagers have a monitor position where you can hear everything on the channel. Only the newest models have more than one channel. The old ones do make good single channel monitors for listening to local fire or PD channels. I have two low band (45 Mhz) Minitor l's with chargers for sale or trade if your interested.

1651. Re: FS: New uniden sport cat scanner

Newsgroup: rec.radio.scanner
Date: 1999-02-16 00:00:00 UTC
From: Radio Daze <radiologist@yahoo.com>
Message-ID: <01be592e$a6cd6980$LocalHost@default>
Source record: 127339
Cross-posted to: phx.buy-sell-trade,az.forsale,rec.radio.scanner

The Sportcat was my first handheld scanner. I bought it at Walmart, and I thought it was really neat. It let me hear the action anywhere I went, it was easy to use, it picked up pretty well, and it even picked up cellular phones.

Now, it's three years later, and I have long-since sold the Sportcat and bought two other handheld scanners. My current favorite is the Yupi 7100, but I credit the Sportcat for making scanning easy enough to let someone like me have a chance to enter the hobby. If a scanner as complicated as the 7100 had fallen into my lap three years ago, I'm afraid I would have given up scanning pretty quickly. The Sportcat is an excellent entry-level scanner, and it wouldn't be a bad one to keep around as a secondary unit. I wish I still had mine!

I second the motion that the 7100 is probably the best scanner if sensitivity is important to you. I live in a small town, surrounded by small towns every 15 miles, and I can listen to the police in as many towns as I want with just the stock telescopic antenna. Besides, the 7100 is so good that I use it as my primary radio for AM, FM, shortwave, weather, civilian air, military air, cb, television audio, etc. I would truly be lost without my 7100!

This Radio is for trade only. I will not sell it.....trade for one of
the below items.

I have a Icom IC-T8A TRI-BANDER (mint)
2-6-440 bands
Box
Manual
Charger
Icom BP-200 9.6v 680mAh Ni-MH
Maha BP-200 9.6v 680mAh Ni-MH
SMA adapter
Maha Speaker Mic

Read about it here:
http://hamstation.com/icpict8.htm

I want to trade for one of the following (ONLY)

Icom PCR-1000 unblocked
Yupiteru MVT-9000
Yupiteru MVT-9000M3
AOR-8200
Alinco DJ-X10

Again...I am *only* interested in trades on the above. No others.

go to your local R a d i o S H A C K-up
store and ask their sales wizzes what the
scoop is on their scanners. Take an hour
or two....get them to answer your questions
and promise to honor your "SAfeway Discount"
stickers for more stuff

then go to another store selling them.

then think about what you were told.

then find uniden bearcat's www site
and see what used scaners they have....

fully warranteed.

then look around in the NG's for used
scanners for sale and choose

do it yourself, you will respect yourself
in the morning....

> can I get some input as to what types to check out?

One of the best bangs for the buck would be the RELM HS200. It
has excellent performance and a decent set of features. Goes for
about $180 these days. You might also look into the Uniden
BC235XLT for a similar price.

The next step down in price would probably be the Uniden SC150
SportCat for $150 or less.

Below this would be the BC120XLT, BC80XLT and BC60XLT and their
equivalent Radio Shack models.

If you get the chance, stop by my site and do some browsing
and self-education. Good luck!

I can put in the frequencies for Manatee County Florida which is on a 800 system GE Ericcson. Why do some frequencies just before they talk make a wierd humming noise and some do not, is this that they are digitizing some of there channels and not all of them. I can hear on every frequency just some better than others. By the way every once in a while I will hear a telephone on one of the channels, which I have heard is a telephone patch to one of there channels these come in very clear as well. With what I am able to hear is it still worth purchasing a trunk tracker.

1673. QUESTION: NOAA Weather Radio

Newsgroup: rec.radio.scanner
Date: 1999-02-16 00:00:00 UTC
From: mach5mike@aol.com
Message-ID: <19990216143934.24035.00001330@ng-cb1.aol.com>
Source record: 127361

I did not know where to post this question so excuse me for posting here if it does not apply.

I just purchased a NOAA Weather Radio from Radio Shack (#12-249). This radio has the S.A.M.E. (Specify Area Message Encoding) alert feature which sounds an alarm if there is a warning in your SPECIFIC area or County.

Questions:
1.) Since my specific area consists of Cook County, IL (which is VERY large anyway), would I be better off by buying a less expensive weather radio that does not use the S.A.M.E. technology? Meaning, is this SAME feature necessary in such a large county.

2.) From how far away would a regular, non-SAME weather radio receive its alert signal?

3.) Would a regular, non-SAME weather radio receive any NOAA alert signal if it's within receiving range?

Thanks,
Mike

Personally, I prefer the handheld type. (I have a Yupiteru 7100)

You can take handhelds anywhere AND they work when there is no power at your house (with the power out you can still listen to: weather info., emergency personnel, who's looting in your neighborhood...fun stuff like that.).

Not yet. The current Trunk Trackers can only track Motorola trunking. The
BC-245 will be able to do Ericsson, but it won't be available for a few
months yet.

Isn't SELCAL, the same as CTCSS... not sure? If it is, then it's not encrypted, or encoded. I'm not sure what you're trying to do?

I would like to decode the sideband reception on the 25 to 27 mhz
range.Using my rs2006 scanner.
It it possible? via a software program connected to the sb16 inputs.

I live in Dallas County and the "normal wx alerts for our area encompass several adjacent counties. However, knowing the usual movement of any severe storms would preclude my wanting to hear alerts for counties East of Dallas. Therefore, I would program it to alert on the counties West, SE and NE of me ONLY.

I do not know how our counties sizes compare, but would assume the same principal would apply.

>

Should NOT be any difference. The "SAME" signal is attached to the regular "tone alert" built into the normal radios.

>
> 3.) Would a regular, non-SAME weather radio receive any NOAA alert signal if it's
> within receiving range?

As with ANY radio, the distance from the transmitting station, terrain, power of the transmitting station are the factors. There would NOT be any difference in the SAME & non-SAME receivers.

>in such a large county.

The S.A.M.E. technology encodes a special signal which tells you the type of
threatening weather (hurricane, tornado, flood, etc.). It also squelches
alert tones from neighboring areas. The ranges are approximately 20-40 miles.
Is this bigger than your county? If no,
then you could survive without just a standard alert tone weatherradio, because
all the alerts would probably be just for your area. Maybe you WANT to hear
alerts for adjacent areas, just to know what's going on?

>2.) From how far away would a regular, non-SAME weather radio receive its
>alert
>signal?

20-40 miles. During storm intensity, the range decreases because of
interference.

>3.) Would a regular, non-SAME weather radio receive any NOAA alert signal if
>it's within receiving range?

Of course. Radio Shack's: 12-1610, 12-247, 12-246 are all standard Alert
weatherradios, meaning you can put them in "Stand-by Mode" and they will stay
quiet until they receive ANY alert from ANY area within receiving distance.
All other non-Alert weatherradios do not have "Stand-By Mode" so as you are
listening to regular weather forecast, the forecast is suddenly interrupted by
an alert tone. However, had the non-Alert weatherradio been turned off, you
would never hear the alert tone.

How do you mean 'program' it?

In itself it doesn't need to be programmed. You simply connect
it to the serial port and the scanner or receiver. The HamComm
program then takes the output from the modem and processes it
for display on the computer screen.

It's very easy to get working if you have a decent HF receiver.
Probably work reasonably well from a scanner with a good HF
scanner.

Cross-posted to: rec.radio.scanner,rec.radio.shortwave,rec.radio.swap

Archive-name: radio/personal-intro

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, WH6U, (jeffreyh@hawaii.edu), or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL

bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec.radio.info-moderator@primenet.com. Inquires and other adminis-trivia should be directed to rec.radio.info-request@primenet.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications. Each of these subgroups has its own charter and FAQ; please refer to the archives to find these documents.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to:
majordomo@piobaire.mines.uidaho.edu and only write:
subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

We now have a list devoted to amateur radio history. To subscribe, send an email to: ham-radio-history-subscribe@egroups.com - leave the body of the message blank.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see the excellent web site http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========
